Patient Name: Karima Mokhtar Ali Badr	Date : 09/11/2023
Exam : ultrasound BREAST (BOTH SIDE)	Age : 49 Year(s)
Medical ID: 2330/2023	Pat. ID: 43850

FOLLOW UP BILATERAL BREAST ULTRASOUND

INDICATION:

- Follow up post chemotherapy for left breast neoplastic process.
- In correlation to the previous study of 30/5/2023

REPORT:

Regressive course as regards the size of the previously detected:

- Left breast UIQ (11 o'clock) spiculated hypoechoic mass, currently measuring 1.7x2.6cm (was 2.2x5.6cm in the previous study), showing regressive course (the previously reported calcifications reaching the nipple are to be considered).
- No Left pathological axillary LNs
- No supra clavicular LNs seen
- No right breast suspicious mass lesions.
- Normal skin thickness and contour.
- Normal nipple areola complexes.
- Right non specific axillary lymph nodes.

OPINION:

- Follow up post chemotherapy for a case of left breast malignancy, showing partial radiological response (BIRADS 6).
- Signature Dr. Engy Abdallah
- 09/11/2023 3:41 Pm

PATIENT NAME KARIMA MOKHTAR ALI BADR	PATIENT ID #: 20223000562
GENDER: Female	ORDER #: Z8129,Z8130
AGE: 48 y	DATE OF SERVICE: 30-May-2023 01:28 PM

Report: - all studies

**FULL FIELD DIGITAL MAMMOGRAPHY AND COMPLEMENTARY
ULTRASOUND**

INDICATION:

- Palpable left breast lump, of 1 month duration.

TECHNIQUE:

- CC and MLO views of both breasts.
- Complementary ultrasound

REPORT:

- Bilateral heterogeneously dense breasts (ACR C).
- Left breast upper and lower inner quadrant, grouped, pleomorphic microcalcification.
- Complementary Ultrasound showed an irregular, ill-defined, hypoechoic mass lesion that shows possible intraductal extension and considerable vascularity on color Doppler interrogation, seen centered over 11 o'clock location of the left breast (site of clinically palpable lump). It measures approximately 5.6X2.2 cm along its maximal cross sectional dimensions. It shows echogenic calcifications within.
- An area of altered parenchymal echogenicity is seen centered over 9 o'clock location of the left breast, with echogenic calcifications noted within, is seen measuring approximately 4X1.4 cm along its maximal cross sectional dimensions. Mild diffuse thickening of the overlying skin is noted (reaching a thickness of 5 mm).
- Multiple, variable-sized, anechoic, avascular simple cysts are seen scattered within both breasts.
- Normal skin thickness and contour.
- Normal nipple areola complexes.
- A small, left axillary lymph node (level I) appears globular (approximately 0.5 cm along its maximal diameter) and muffled hilum.
- Right axillary lymph nodes show average cortical thickness and preserved hila.
- No ultrasonographic evidence of suspicious supra or infraclavicular lymphadenopathy.

OPINION:

- Left breast infiltrative malignant-looking process, with suspicious microcalcification and indeterminate ipsilateral axillary node, as above described, for histopathological verification (BIRADS 5).
- Bilateral fibrocystic changes.

Recommendation - all studies

Referral to clinic

Reported By,

Dr. DALIA EL-MESIEDY, MD

PATIENT NAME: KARIMA MOKHTAR ALI BADR
GENDER: Female
AGE: 48 y

PATIENT ID #: 20223000562
ORDER #: 2333744,2333745
DATE OF SERVICE: 10-Jun-2023 12:38 PM

Report: - all studies

POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN AND PELVIS

1-CHEST

- Left breast UIQ irregular enhancing soft tissue mass lesion is seen measuring about 2.2 x 4.3 cm associated with mild skin thickening.
- No sizable pulmonary nodules, masses, areas of consolidation or cavitary lesions.
- Left LL para-mediastinal benign calcific nodule.
- No CT evidence of pathologically enlarged hilar or mediastinal lymph nodes.
- No evidence of pleural effusion seen.
- Normal cardiac size.
- No pericardial effusion detected.
- Left thyroid lobe tiny hypodense nodule.

2- ABDOMEN AND PELVIS

- The liver is of average size with homogenous CT texture. No focal lesions or intra-hepatic or extra-hepatic biliary radicles dilatation.
- Patent homogeneously enhancing portal vein and its main branches as well as its main tributaries.
- Calcular gall bladder.
- Normal appearance of the pancreas, spleen, kidneys, adrenals, aorta, I. V.C and the pelvic organs.
- Under-filling of the urinary bladder with no filling defects or diverticular outpouching.
- No pathologically enlarged abdominal or pelvic lymph nodes.
- No abdominal or pelvic collections.
- Bulky uterus with heterogenous enhancement and left uterine wall well defined hypodense lesion measuring about 2 x 2.2 cm (? Degenerating fibroid). Left adnexal cysts are also noted, largest is measuring about 2.2 x 4 cm (for clinical correlation +/- local U/S assessment).

The revised bone window revealed:

- 1. No worrisome lytic or sclerotic lesions.
- 2. No CT evidence of vertebral collapse.

Opinion:

- Left breast UIQ malignant-looking mass lesion as described.
- No definite pulmonary, hepatic or osseous metastases.

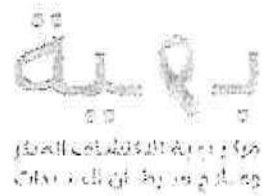

Reported By,

Dr, Peter Fahmy, MD, FRCR

Dr. Fifi Sami, MSc

قسم الأشعة النووية

PATIENT NAME: KARIMA MOKHTAR ALI BADR
GENDER: Female
AGE: 48 y

PATIENT ID #: 20223000562
ORDER #: 2333746
DATE OF SERVICE: 21-Jun-2023 09:18 AM

Report:

99mTc-MDP BONE SCAN

Desired Information: - skeletal survey.

Technique:

Delayed Whole body imaging in anterior and posterior projection performed 2 minutes & 2 hours after I.V administration of 20 mCi **FINDINGS:-**

Degenerative changes at dorso- lumbar vertebrae, more at lower dorsal for follow up.

Arthritic changes at knees and shoulders.

Otherwise, no hot or cold spots that would account for serious bone lesions.

Both kidneys are seen.

Conclusion: -

No definite evidence of metastatic osseous deposits.

Reported By,

Ass. Prof. Huda Fathy Elsayed

Patient Name:	KARIMA MOKHTAR ALI	ID:	
Ref. Phys:		Date:	09/12/2025

MRI OF THE ABDOMEN AND PELVIS :-

The study was performed on a 1.5 Tesla super conducting system.

TECHNIQUE: -

Variable pulse sequences were taken with contrast.

FINDINGS:

- Gall bladder distended with multiple stones.
- Left uterine wall well-defined hypointense small lesion measures about 1 x 1 cm.
- The liver is of normal MRI signal pattern, average size with no focal lesions.
- No intra or extra-hepatic biliary dilatation.
- Normal MRI signal of the spleen with no focal lesions.
- Pancreas is of normal MRI appearance.
- Normal MRI appearance of both kidneys, that show preserved parenchyma with no evidence of focal lesions, no stones or back pressure changes elicited.
- No ascites.
- Normal signal void flow of the major abdominal vessels.
- Normal MRI appearance of the urinary bladder and both ovaries.

OPINION: -

- Calcular gall bladder.
- Left uterine wall fibroid.
- No adnexal mass lesion.

Much Obliged
