Name : Fatima Ahmed Mohammed Youssef

Date : 02-07-2025 09:30

Branch : Maadi

Medical No. : 141353

Ref. Physician : Prof : Hrmal Hospital

Ins. Company : التأمين الصحي

Tc^{99m} MDP SKELETAL SCINTIGRAPHY

History:

- A 41-year-old lady, with history of right breast cancer, referred for metastatic work up.

Technique:

- Anterior and posterior whole body scans were acquired 2 hours post injection of the tracer.

Findings:

The previous scan images are not available for comparison

- Diffuse enhanced tracer uptake is seen at LV4.
- No other abnormal active or cold focal bony lesions could be seen over the surveyed skeleton to account for metastatic bone disease.
- Degenerative changes are seen at the rest of the spine and big joints.

Impression:

- No convincing evidence of metastatic bone disease.
- Equivocal tracer uptake at LV4, likely degenerative, for regional radiological correlation and follow up.

Much obliged
Dr. Alaa Nagi, MD
Consultant of nuclear medicine

		السيد
تحية طيبة وبعد,,		
	بشأن تقرير طبي للمريض	
		إيماء للطلب المقدم من
	رقم طبي:	
		بقسم:
نتشرف بأن نوضح فيما يلي تقريراً عن حالتها		
	تاريخ وساعة الخروج :	تاريخ وساعة الدخول :
وبعد الكشف والفحوصات والمتابعة وجد انها		
The patient has been on adjuvant tamoxifen since February 2025. Her HER2-directed therapy (Herceptin) was discontinued after three months. A contrast-enhanced CT of the chest, abdomen, and pelvis performed on 6 December 2025 demonstrated a stationary hepatic focal lesion (HFL) in segment 8 measuring 10 × 9 mm. After consultation with Dr. Mohamed Ismail, the plan was to continue tamoxifen and follow the hepatic lesion. The current medication regimen includes tamoxifen 20 mg daily, calcium 1 tablet × 1 × 90, and a single dose of Zoladex 10.8 mg subcutaneously. A follow-up triphasic CT CAP performed on 1 April 2026 showed the hepatic focal lesion in segment VIII unchanged at 11 mm, confirming a stationary course. The imaging was ordered for three-month surveillance, and the therapeutic plan was shifted to Zoladex combined with an aromatase inhibitor because tamoxifen was unavailable. Adjuvant therapy was adjusted to anastrozole (Arimidex) with supportive care. The patient received a dental consultation and was scheduled to receive a free dose of Zoladex on 1 July 2026, with the next clinic visit planned for 6 September 2026. The patient's breast cancer is classified as stage II (right breast, CT2, no metastatic disease, IDC grade 8/8, PR 4/8, HER2 3+). She was recommended to continue Zoladex and an aromatase inhibitor, with a repeat CT in April 2026 showing a single segment 8 hepatic focal lesion measuring 11 mm. Additional recommendations included zoledronic acid (Zometa), anastrozole, and Zoladex, with a follow-up scheduled for 2 July. A repeat CT CAP performed in August 2026 demonstrated a regressive course: the previously noted pulmonary and hepatic focal lesions were no longer appreciable, although a small lytic lesion persisted in the left femoral head. The plan is to continue anastrozole for three more months with supportive therapy and to obtain a bone scan. Zoladex was prescribed on 1 October 2026.

Pathology Report

- Perineural invasion: Not detected.
- Microcalcifications: Not detected.
- IPT:
- P63: Positive in all myoepithelial cells around DCIS lesion.
- SMA: Positive in all myoepithelial cells around DCIS lesion.

Diagnosis:

Right breast, simple mastectomy and SLNs Biopsy:

- Residual high grade DCIS (comedo and solid pattern), with positive lymphovascular invasion.
- Free deep surgical resection margin.
- Free skin.
- Free lymph nodes (0/6).
- Complete pathologic response to therapy.
- Stage: ypTis, ypN0.

Pathology Report

Clinical Data: Right breast cancer, post NACT.
Nature Specimen: Right simple mastectomy and SLNs.

Gross Examination:

- Procedure: Right simple mastectomy specimen measured 20x17x4 cm with covering skin ellipse measured 16.5x7.5 cm.
 - Tumor extent: A rubbery greyish white tumor bed site.
 - Size: 7x5x2.5 cm.
 - Skin involvement: Nipple was unremarkable grossly.
 - Distance from margins: 2 cm away from deep margin.
 - Lymph nodes number and size: Fibrofatty tissue piece measured 2.5x2x0.5 cm, entangling 6 nodules (5 were frozen, one left for paraffin), up to 1x0.5 cm.
 - Frozen results: SLN: free in 0/5 lymph nodes.
 - Designation:
 - 1-7: Tumor bed site.
 - 8: Deep margin.
 - 9: Nipple.
 - 10-11: SLNs.
- Dissected by: Dr. Menan Hossam.

Microscopic Examination:

- Histological type: Residual high grade DCIS (comedo and solid)
- Angiolysis: Positive.
- Ductal carcinoma in situ: Residual high grade DCIS (comedo and solid pattern).
- Skin involvement: Free.
- Lymph node involvement: Free in (0/6) lymph nodes.
- Resection Margins: Free deep surgical resection margin.
- Histologic response to therapy: Complete pathological response.

غرفة رقم (4) - الدور الأول - مبنى رقم (987) - كورنيش النيل - مصر القديمة .. القاهرة - مصر
Room No. (4) - First Floor-Building No. 987- Nile Corniche - Msr El Qadima - Cairo, Egypt

Patient Name: Fatma Ahmed Mohamed Youssef	Date : 30/07/2025
Exam : CT CAP+C (CT Chest Abd. Pelvis)	Age : 41 Year(s)
Medical ID: 2863/2024	Pat. ID: 76644

POST-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN, AND PELVIS:

Findings:

Known case of BC compared to last study dated 22/7/2024

I Chest:

- Right mastectomy with clear operative bed.
- No pathological right axillary lymph nodes.
- Still noted right lower lung lobe lateral basal segment fissural based 2 mm nodule.
- No pathological hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

II Abdomen & pelvis:

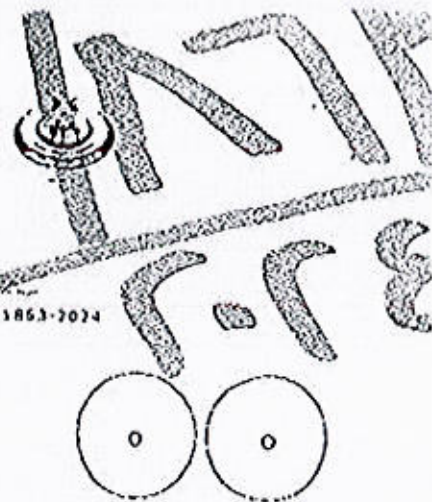

- Enlarged size of the liver with homogenous CT texture. Small segment VIII enhancing focal lesion 10 x9mm.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, and both suprarenals.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.
- Scanned skeleton show L4 first degree lytic spondylololthesis,
- Small lytic lesion of left femoral head.
- **Opinion:**
- **Known case of BC compared to last study**
 - Progressive course regarding right hepatic lobe focal lesion .
 - Left femoral head lytic lesion for correlation with bone scan.
 - Rather stationary course of rest of study.

Hospital: Goustave Roussey International Egypt

POST-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN, AND PELVIS:

Findings:

Known case of breast CA compared to last study dated 6/12/2025, the current study showed:

I Chest:

- Right mastectomy with clear operative bed.
- No pathological right axillary lymph nodes.
- Still noted two tiny right upper lobe pulmonary nodules.
- Still seen multiple bilateral scattered upper and lower lobe ground glass densities.
- No pathological hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

II Abdomen & pelvis:

- Enlarged size of the liver with homogenous CT texture showing no appreciable time interval changes regarding the appearance of the previously seen small segment VIII enhancing focal lesion still measuring 11 mm in diameter.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, and both suprarenals.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.
- Scanned skeleton still shows first degree lytic anterolisthesis of L4 over L5 vertebra,
- Still noted small lytic lesion at the left femoral head.

Opinion:

- Stationary course since last study.

Clinical Data

BX: IDC, G-II

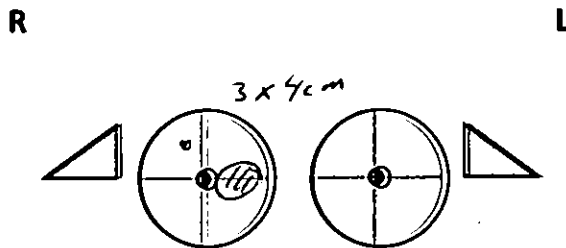

ER: 8/8 PR: 4/8 HER2: +3 Ki67: 15%

Sonomammography:

*CESM (24/8/2024): Multi-centric Rt. Breast process.

Mets Workup:

*CT CAPE (22/7/2024): - only L4 lesion.
* Bone scan (24/8/2024): - Equivocal L4 lesion.
* MRI Lumbar spine → requested

TNM

Recommendations:

Triple Positive Rt. Breast Ca.
* Planned to start Neo-adj. TCHP. → started
1st TC on 4/9/2024.
CT2 cN1 M? → L4 lesion seen in both CT CAP, Bone scan. "Pending MRI".
↳ Indeterminate 3mm IN.

- *CESM → Revealed multi-centric Process in Rt. Breast. & one clip is inserted
- * There is Single L4 lesion seen in CT CAP, Bone scan.

MDT OUTCOME & PLAN

* Kindly, advise for further plan of H. & MRI lumbar spine pending.

Pathology Report

Clinical Data: Right breast cancer, post NACT.
Nature Specimen: Right simple mastectomy and SLNs.

Gross Examination:

- * Procedure: Right simple mastectomy specimen measured 20x17x4 cm with covering skin ellipse measured 16.5x7.5 cm.
 - * Tumor extent: A rubbery greyish white tumor bed site.
 - * Size: 7x5x2.5 cm.
 - * Skin involvement: Nipple was unremarkable grossly.
 - * Distance from margins: 2 cm away from deep margin.
 - * Lymph nodes number and size: Fibrofatty tissue piece measured 2.5x2x0.5 cm, entangling 6 nodules (5 were frozen, one left for paraffin), up to 1x0.5 cm.
 - * Frozen results: SLN: free in 0/5 lymph nodes.
 - * Designation:
 - 1-7: Tumor bed site.
 - 8: Deep margin.
 - 9: Nipple.
 - 10-11: SLNs.
- Dissected by: Dr. Menan Hossam.

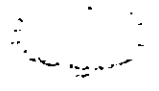

Microscopic Examination:

- * Histological type: Residual high grade DCIS (comedo and solid)
- * Angioinvasion: Positive.
- * Ductal carcinoma in situ: Residual high grade DCIS (comedo and solid pattern).
- * Skin involvement: Free.
- * Lymph node involvement: Free in (0/6) lymph nodes.
- * Resection Margins: Free deep surgical resection margin.
- * Histologic response to therapy: Complete pathological response.

PATIENT NAME: FATMA AHMED MOHAMMED YOSEF**GENDER:** Female**DATE :** 24-Aug-2024 10:56 AM**PATIENT ID:** 10124247965**AGE:** 40 y**ORDER:** 3002494,3002779**CONTRAST ENHANCED SPECTRAL MAMMOGRAPHY****INDICATION:**

- Right breast pathologically proven malignancy (outside Baheya)

TECHNIQUE:

- Contrast Enhanced Spectral Mammography CC and MLO views
- IV non-ionic contrast medium infusion 100 ml of omnipaque

REPORT:**RIGHT BREAST:**

- Contrast Enhanced Spectral Mammography LIQ and UIQ heterogenous malignant mass and non mass enhancement seen collectively measuring about 10x4 cm (related to the area of asymmetrical density harboring malignant pleomorphic microcalcifications seen in 2D mammography) corresponding to U/S to few intercommunicating ill defined spiculated mass lesions seen from 2 to 5 o'clock surrounded by distorted parenchyma and showing anterior ductal extensions reaching the nipple (associated with mild deviated nipple).
- Another UOQ well defined heterogeneously enhancing mass lesion measuring about 2x1.8 cm corresponding by U/S to 11 o'clock well defined microlobulated solid mass lesion with mild internal cystic changes measuring about 1.8x1 cm.
- Normal skin thickness and contour.
- Indeterminate axillary (level I) lymph nodes with mild increase of cortical thickness reaching about 3.4 mm.
- No pathological infra or supraclavicular lymph nodes.

LEFT BREAST:

- Contrast Enhanced Spectral Mammography showed moderate symmetrical back ground parenchymal enhancement denoting adenosis.
- No left breast mass or non mass enhancement.
- Normal skin thickness and contour.
- Normal nipple areola complexes.
- Non specific axillary lymph nodes.

PATIENT: FATMA AHMED MOHAMMED YOSEF, 10124247965, Female, 40 y

Report version 1, 24-Aug-2024 12:22 PM

Page 1 of 2

OPINION:

- Right breast locally advanced pathologically proven malignant mass an non mass enhancing lesions with indeterminate axillary lymph nodes (BIRADS 6).
- Right UOQ suspicious heterogeneously enhanced mass lesion ??
- Multicentric process for histopathological correlation (BIRADS 4c).
- No left breast pathological mass or non mass enhancement (BIRADS 2)

Referral to clinic.

IMMUNOHISTOCHEMISTRY REPORT

Clinical Data: Right breast mass.

Nature of Specimen: Tru-cut biopsy, collected at 1/7/2024, 10:30 am.

Technique:

Sections were prepared from the paraffin block, processed in BenchMark ULTRA machine (Ventana) and stained by rabbit monoclonal antibodies using ultra view HRP DAB as chromogen and hematoxylin as counter stain. The sections treated against:
ER clone (1E2), PR clone (SP1), Her2 clone (4B5), & Ki67 clone (30-9).

Results:

IPT (Positive control showed appropriate reactivity):
ER: Strong nuclear reaction in 90% of tumor cells (score 8/8).
PR: Moderate nuclear reaction in 5% of tumor cells (score 4/8).
Her2: Strong complete membrane reaction in >10% of tumor cells (score 3+).
Ki67: 15% nuclear reaction of tumor cells.

Conclusion:

Right breast mass, Tru-cut biopsy:
Invasive duct carcinoma, Grade II.
PT:
ER: Positive (score 8/8).
PR: Positive (score 4/8).
Her2: Positive (score 3+).
Ki67: Positive in 15% of tumor cells.

Scoring system: "ER, PR"

99MTC-MDP BONE SCAN

Desired Information: -
skeletal survey.

Technique:

Delayed Whole body imaging in anterior and posterior projection performed 2 hours after I.V administration of 20 mCi 99m Tc-MDP in the following manner:

Report:

Warm tracer uptake is seen involving LV4 of equivocal nature ?? Degenerative ?? Metastatic for CT correlation and follow up.
Degenerative changes are seen over dorso-lumbar vertebrae.
Otherwise the rest of surveyed skeleton is free from serious bone lesions.
Both kidneys are normally visualized.

Conclusion:

Equivocal LV4 lesion for CT correlation and follow up to exclude the less likely possibility of metastatic osseous deposit.

Reported By,

Prof. Huda Fathy, Nuclear Medicine Consultant

Dear Prof Dr: ABD ELMONEM SHEHATA (The King of Surgery)

Duplex, sonomammography of the right breast revealed: -

An irregular, speculated, hypoechoic, nonparallel (taller than wide) mass with punctate calcification is seen at 2 O'clock, the lesion measures 3 x 3 x 2.5 cm.

Four, enlarged, lymph nodes are seen:

- One at 12 O'clock (1.6 x 1.5 x 0.7 cm).
- One at 9 O'clock (2.6 x 1.6 x 1 cm).
- Two, medial wall, axillary (1.4 x 1.1 x 0.8 cm).

CONCLUSION:-

- ❗ A malignant-looking, right, breast mass (3 x 3 x 2.5 cm).
- ❗ Lymph nodes enlargement, as described above.

Yours sincerely,

د: أحمد خيري شعراوي

Patient Name: Fatma Ahmed Mohamed Youssef	Date : 22/12/2024
Exam : ultrasound BREAST (BOTH SIDE)	Age : 41 Year(s)
Medical ID: 1863/2024	Pat. ID: 76644

**DIGITAL BILATERAL SOFT TISSUE MAMMOGRAPHY AND
COMPLEMENTARY ULTRASOUND**

Indication:

Right breast cancer for follow up after NACT

Report:

Scattered fibroglandular tissue(ACR B)

Right Breast:

Still noted right UIQ coarse heterogenous microcalcifications.

With clip within measures 95 x 46 mm and 15 mm away from the nipple.

Stable right UOQ well defined oval shaped equal density lesion.

Complementary US shows **vanished** right 3 o'clock irregular hypodense mass lesion that was measuring about 32 x 14 mm.

Stable right 12 o'clock well defined isoechoic oval parallel mass measuring 20 x 11 mm.

Still noted multiple retroareolar anechoic dilated ducts the largest reaching 6 mm.

No pathological enlarged axillary lymph nodes

No pathological enlarged infra or supraclavicular lymph nodes.

Left Breast:

Scattered fibroglandular tissue(ACR B)

No suspicious micro calcifications or architectural distortion detected.

Complementary ultrasound no cystic or solid mass lesions.

Normal skin thickness, and nipple-areola complex with average caliber of the retro-areolar central ducts.

Nonspecific axillary LN.

Opinion:

Status follow up showing good radiological response of right breast malignant mass (BIRADS 6).

Stable right Probably benign breast mass likely a fibroadenoma.

Signature Dr. Wafaa Ali

DIGITAL BILATERAL SOFT TISSUE MAMMOGRAPHY AND COMPLEMENTARY ULTRASOUND

Indication:

Right breast palpable mass

Technique

- Bilateral MLO and CC views
- Bilateral 3D MLO DBT (Digital Breast tomosynthesis)
- Bilateral breast ultrasound

Report:

- Right Breast:
 - Scattered fibroglandular tissue(ACR B)
 - Partially obscured high density lesion is seen in the right UIQ with adjacent spicules and overlying coarse heterogenous microcalcifications.
 - Right UOQ well defined oval shaped equal density lesion.
 - Complementary US shows right 3 o'clock irregular hypodense mass lesion measuring about 32 x 14 mm, 5mm from the skin, 37 mm from the nipple.
 - Right 12 o'clock well defined hypoechoic oval parallel mass measuring 20 x 11 mm.
 - Multiple retroareolar anechoic dilated ducts the largest reaching 6 mm.
 - No pathological enlarged axillary lymph nodes
 - No pathological enlarged infra or supraclavicular lymph nodes.
- Left Breast:
 - Scattered fibroglandular tissue(ACR B)
 - No suspicious micro calcifications or architectural distortion detected.
 - Complementary ultrasound nc cystic or solid mass lesions.
 - Normal skin thickness, and nipple-areola complex with average caliber of the retro-areolar central ducts.
 - Nonspecific axillary LN.

Opinion:

- Right breast malignant mass (BIRADS 4c) for histopathological examination.

Patient Name: Fatma Ahmed Mohamed Youssef	Date : 29/07/2024
Exam : ultrasound BREAST (BOTH SIDE)	Age : 40 Year(s)
Medical ID: 1863/2024	Pat. ID: 76644

- Right Probably benign breast mass mostly a fibroadenoma (BIRADS 3) for better histopathological assessment.
- Normal sonomammography of left breast (BIRADS 1)

Exam : ultrasound ABDOMEN& PELVIS	Age . 40 Year(s)
Medical ID: 1863/2024	Pat. ID: 76644

ABDOMINO-PELVIC ULTRASOUND EXAMINATION REVEALED:

Liver: -

- Average in size (15cm at Rt MCL) homogenous parenchymal echopattern with smooth surface.
- No hepatic focal lesions or intra hepatic biliary radicle dilatation.
- Portal vein is patent and not dilated.

Gall Bladder: -

- Average distention and capacity with no stones or mud
- The wall is not thickened.
- CBD is not dilated.

Spleen: -

Average size, homogenous.

Kidneys: -

- Both are average in size, shape and echogenicity
- No stones or dilated pelvicalyceal system
- No gross lesion

Para-aortic and pancreatic area: show no gross abnormalities.

No ascites

Urinary Bladder: -

- Average capacity with no stones or diverticular out pouching

Uterus and adnexal: bulky uterus ,endometrial thickness=1cm
cervical Nabothian cyst 8mm.

Opinion:

BULKY UTERUS

Signature Dr . Nermien Ramadan
