	رقم طبي:	بقسم:
ننشر بأن نوضح فيما يلي تقريراً عن حالته		
	تاريخ وساعة الخروج :	تاريخ وساعة الدخول :
وبعد الكشف والفحوصات والمتابعة وجد انه		
The patient is a 60-year-old individual with a history of hypertension and bilateral breast cancer. The right breast tumor is estrogen-receptor (ER) 8/8, progesterone-receptor (PR) 4/8, HER2-negative, staged clinically as T4N1M1 with de novo bone metastases. The left breast tumor is ER 7/8, PR 4/8, HER2-negative, staged clinically as T4N2M1. Bone scintigraphy performed in May 2024 demonstrated metastatic osseous lesions. A CT of the chest, abdomen, and pelvis in October 2025 showed stable disease, and a repeat bone scan in November 2025 indicated a stationary course. The patient received weekly Taxol combined with Zometa administered every three months, completing nine months of this regimen, with the last Zometa dose given in November 2025. Therapy was then transitioned to letrozole (Femara) together with Zometa every three months beginning in July 2025. Palliative radiotherapy was delivered to the left shoulder in December 2025. The plan at that time was to obtain a new CT CAP to assess treatment response. A CT CAP was performed without a direct comparison; the study was sent for comparison with the prior imaging to evaluate response to Zometa and to assess the elevated CA 12.73 level. Pharmacy records indicate the patient's weight is 112 kg, height 160 cm, and that Zometa and Femara (letrozole) were continued, with a serum calcium of 0.59 mmol/L and CA 12.73 noted. The patient received Femara and supportive therapy today, with a supply intended for two months as ordered by pharmacy. A repeat CT CAP performed in February 2026 demonstrated stable disease. The plan was to continue Femara and supportive care, and to administer Zometa every three months after laboratory results are reviewed, with pharmacy coordination. The most recent instruction was to give Zometa after laboratory results, to add one ampoule of calcium, and to note that the CT from February 2026 showed stable disease, as did the bone scan from November 2025; the plan is to obtain a new CT and bone scan.

PATIENT ID: 19124242681
AGE: 58 y
ORDER: 2860557

99MTC-MDP BONE SCAN

Desired Information:
Skeletal survey.

Technique:
Delayed Whole body imaging in anterior and posterior projection performed 2 hours after I.V administration of 20 mCi 99m Tc-MDP in the following manner:

Report:

Active osseous lesions are seen involving the skull, sternum, both scapulae, DV12, few pelvic bones, trochanter of both femora and likely LV4. Degenerative changes are seen over dorso-lumbar vertebrae. Arthritic changes are seen over both knees. Both kidneys are normally visualized.

Conclusion:

Abnormal metastatic osseous deposits at the above mentioned sites.

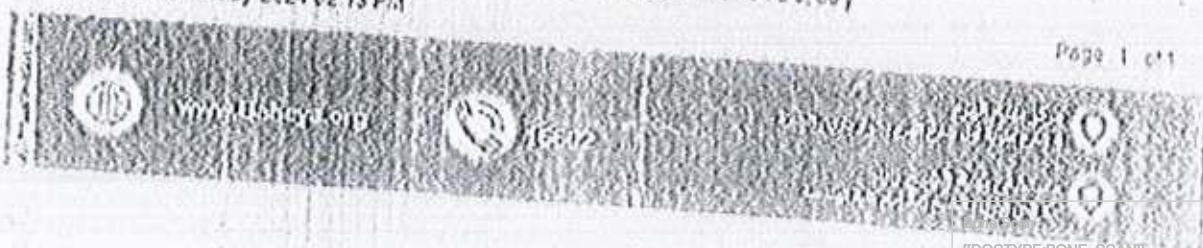

Reported By,

Prof. Huda Fathy, Nuclear Medicine Consultant

PATIENT: LAYLA MOHAMMED ABDULGHAFFAR AHMED, 19124242681, Female, 58 y
Report version 1, 26-May-2024 02:13 PM

Page 1 of 1

Patient Name: Laila Mohamed Abdel Ghaffar Ahmed	Date : 26/04/2025
Exam : C.T CHEST	Age : 59 Year(s)
Medical ID: 1536/2024	Pat. ID: 53907

NON-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN AND PELVIS REVEALED:

Reported case of bilateral breast cancer.

I. Chest

As compared to the last chest study dated 22/02/2025

- **Stationary course:**
 1. Of Left breast multiple irregular spiculated soft tissue lesions, the largest seen retro-areolar measuring 5.8X5 cm I
 2. regarding the size and number of the left axillary level I and, II pathologically enlarged lymph nodes the largest at group I measures 3.1X3 cm.
 3. of the subcentimetric right axillary level I lymph nodes.
 4. of the small left Internal mammary lymph node.
 5. Bilateral diffuse mosaic attenuation with scattered atelectatic bands
- No sizable pulmonary nodules, masses or cavitary lesions
- No pathological hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Average cardiac size. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

II. Abdomen and pelvis

As compared to the last chest study dated 09/9/2024.

- The liver is enlarged homogenous CT texture. The previously mentioned hepatic dome hypodense focal lesion measuring 1 cm is not seen currently on non-enhanced CT basis.
- No Intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- No pathological abdominal or pelvic lymph nodes.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes. Left cortical cyst 23 x 16 mm
- Bulky left adrenal gland with small hypo to isodense lesion 12 x 10 mm
- Right suprarenal gland shows hypodense lesion measuring 11X8mm.
- Normal appearance of the pancreas, aorta, I.V.C and right supra-renal.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- IUD seen in place.
- Normal appearance of the other pelvic organs.

Patient Name: Laila Mohamed Abdel Ghaffar Ahmed	Date : 23/12/2024
Exam : C.T CHEST	Age : 58 Year(s)
Medical ID: 1536/2024	Pat. ID: 53907

- Still noted Bulky left adrenal gland with small hypo to isodense lesion 12 x 10 mm.
 - Normal appearance of the pancreas, aorta, I.V.C and right supra-renal.
 - Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
 - IUD seen in place.
 - Normal appearance of the other pelvic organs.
 - No abdominal or pelvic masses or collections.
3. The scanned skeleton:

More sclerosis of some of the widespread axial and appendicular skeleton sclerotic and lytic lesions.

OPINION:

- Regressive course of the left breast spiculated mass lesion and left axillary lymph nodes as described
- More sclerosis of some of the osseous metastatic deposits suggesting favorable therapeutic response.

Dr. Fatma Ahmed

Pathology Report

Clinical Data

Left breast cancer with right axillary lymph node

Nature of specimen

Tru cut biopsy, collected at 22/5/2024, 10:30 am

Gross examination

Multiple grayish white tissue cores up to 1.5 cm, totally submitted.

IHC technique: Sections prepared from paraffin block for Immune-staining using Bench

Mark ULTRA system for ER, PR, HER2, ER clone (1E2), PR clone (SP1), HER-2 clone (4B5), & Ki67 clone (30-9).

Microscopic examination

- * Histological type: Invasive duct carcinoma, No nodal tissue
- * Grade (differentiation + nuclear pleomorphism + mitosis): (3+2+2) Grade II
- * DCIS: No
- * Angiolymphatic invasion: Couldn't be detected in the received biopsy
- * Perineural invasion: No
- * IPI (Positive control showed appropriate reactivity):
- * E-cadherin: Positive
- * GATA3: Positive
- * ER: Strong nuclear reaction in 80 % tumor cells (Allred score 8/8)
- * PR: Weak nuclear reaction in 10 % tumor cells (Allred score 4/8)
- * HER2: No membrane reaction in of tumor cells (score 0)
- * Ki 67: 25 % nuclear reaction of tumor cells

Pathology Report

Diagnosis

Right axillary mass, Tru cut biopsy.

Metastatic Invasive duct carcinoma, Grade II, No nodal tissue in cores

IPI:

- * ER: Positive (score 8/8).
- * PR: Positive (score 4/8).
- * HER2: Negative (score 0).
- * Ki67: Positive in 25% of tumor cells.
