Primary Sample :

Three immunostained slides labelled Egypt Air , 58-23 , ER , PR and Ki67

Test :

ER & PR & Ki67 ( ER & PR: Harvey scoring system )

Comment :

Technique :

Result :

ER: strong nuclear staining of 95 % of tumour cells  
PR: strong nuclear staining of 90 % of tumour cells  
Ki67: positive nuclear staining of > 20 % of tumour cells

Referral Lab :

Comment :

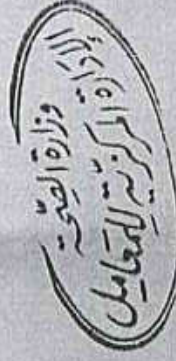

Conclusion :

ER: POSITIVE (SCORE 8/8)  
PR: POSITIVE (SCORE 8/8)  
#Ki67: THE PROLIFERATION INDEX OF THE TUMOUR IS > 20 %

Pathologist:

### CT SCAN OF THE CHEST

**HISTORY:** A known case with right breast cancer on follow up. Compared to the last available previous study dated 28/01/2025, the current study reveals:

#### TECHNIQUE:

Axial contiguous thin cuts were taken through the chest after IV contrast injection.

#### FINDINGS:

- Progressive course is noted regarding the size of the previously noted large irregular right breast malignant looking mass lesion currently = 50 x 48 mm compared to 39 x 38 mm in average on the previous study.
- A stationary course is noted regarding the size of the irregular suspicious malignant looking satellite lesions with the largest currently = 39 x 30 mm.
- Progressive course regarding the size of the suspicious looking right axillary lymphadenopathies with the largest currently = 31 x 21 mm compared to 20 x 20 mm.
- Complete resolution of the previously noted right upper lobe apical solid pulmonary nodule as well as few right upper lobe patchy areas of ground glass opacities.
- A stationary course of mild likely encysted right side pleural effusion.
- A progressive course regarding The size of the right paratracheal lymphadenopathies with the largest currently = 24 x 21 mm.
- Stationary course is noted regarding the previously noted abnormal right breast skin thickening and edema.
- Still noted few bilateral pulmonary atelectatic bands.
- No evidence of abnormal masses, other nodules or consolidative patches.
- Normal CT appearance of the mediastinum vessels.
- No other sizable mediastinal or hilar adenopathy.
- Patent tracheobronchial tree with no abnormal bronchial dilatation.
- No left side pleural or pericardial effusion.
- Cardiomegaly is still noted.

#### IMPRESSION:

- > A follow up study reveals progressive course regarding the size of the right breast malignant looking mass lesions as well as the size of the right axillary malignant looking lymphadenopathies and the right paratracheal lymphadenopathies.
- > A stationary course regarding the right breast satellite lesions and the encysted right side pleural effusion
- > Complete resolution of the right upper lobe pulmonary changes.
- > Stationary courses regarding the pulmonary atelectatic bands and the cardiomegaly.

Much obliged,

Dr. Ahmed M. Osman, MD

Professor of Radiodiagnosis, Ain Shams University

POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST WITH CORONAL RECONSTRUCTION

- A known case of right breast cancer. No available previous studies

Findings:

- Clear both lung fields. No sizable pulmonary nodules, masses, areas of consolidation or cavitary lesions.
- No hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.
- The right breast shows diffuse skin thickening with an upper outer speculated irregular mass lesion measuring 26 x 28 mm with surrounding two satellite lesion measuring 21 x 16 mm and 23.3x 19 mm. Few suspicious looking right axillary lymph nodes, the largest is measuring 10 x 9.5 mm for dedicated sonomammographic assessment

Opinion:

- A known case of right breast cancer. No available previous studies
- Diffuse right breast skin thickening with an upper outer speculated irregular mass and few surrounding satellite lesions together with few suspicious looking right axillary lymph for dedicated sonomammographic assessment

Thank you for your referral

Yours truly,

Dr. Dalia El-Mossly, MD, FRCR

Consultant of Radiodiagnosis, Ain Shams University

### Tc-99m MDP Bone Scan

In comparison to previous scan on 27/2/2024 (~ 1 yr)

- ❖ Present scan reveals newly developed foci of enhanced tracer uptake at cervico-dorsal spine, 12<sup>th</sup> dorsal vertebra and L1 sacro-iliac joint suspecting early bone metastatic deposits. Clinical and radiographic correlation is recommended.
- ❖ The rest of surveyed skeleton shows nearly the same tracer biodistribution as before with no abnormality suspected for destructive osteoblastic deposits.
- ❖ Osteoarthritic reactions are still suggested for shoulders. Bilateral trochanteric bursitis is also still impressed.
- ❖ Rt breast shadow is markedly enlarged in present scan with dense soft tissue count indicative of edema, to check clinically.
- ❖ Rt kidney is atrophied & ptosed with activity retention while Lt kidney shows compensatory hypertrophy.

| PATHOLOGY & CYTOLOGY REPORT   |  |                   |           |
|-------------------------------|--|-------------------|-----------|
| Patient Name: مفيدة اسامه عمر |  | Sex: F            | Age: 44 y |
| Referred by: Dr. Waleed Hetta |  | Dept.: Radiology  |           |
| Code: 01284324                |  | Report No.: 23-58 |           |

Specimen(s): 1. Core biopsy, axillary lymph node . 2. Core biopsy, breast mass

Clinical Data: Suspicious right breast mass – Axillary lymph nodes

**Gross Description:**

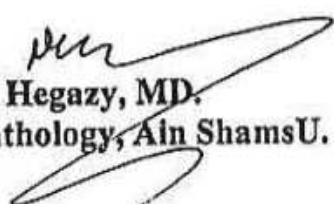

1. Core of soft tissue measuring 1 cm long. Totally submitted in 1 cassette.
2. Two cores of soft tissue; the longest is 1.5 cm. Totally submitted in 1 cassette.

**Microscopic Description:**

1. Sections reveal invasive nests and sheets of malignant epithelial cells exhibiting moderate anaplasia with poor attempts at tubular differentiation. No lymphoid tissue is included.
2. Sections reveal invasive nests, sheets and cords of malignant epithelial cells exhibiting moderate anaplasia with poor attempts at tubular differentiation. There is considerable mitotic activity. No in situ component is detectable.

**Pathologic Diagnosis:**

1. Core biopsy, axillary lymph node: Positive for carcinoma
2. Core biopsy, breast mass: Invasive duct carcinoma, grade II

### Immunohistochemistry Report

Specimen(s): Referred paraffin block (labeled as 58-23 (2) )

Diagnosis: Right breast mass: Invasive duct carcinoma

#### Technique:

Sections were prepared from the paraffin block, processed in Benchmark Ultra machine (Ventana) and stained by monoclonal antibodies and detection kit using Ultra view HRP DAB as chromogen and hematoxylin as counter stain. The sections were treated against ER, PR, HER-2 neu & ki67

#### Immunohistochemical Results:

- Estrogen Receptors: Strong positive staining of 90% of tumor cells. Allred score 8/8
- Progesterone Receptors: Moderately intense positive staining of 80% of tumor cells. Allred score 7/8
- HER-2 neu: Equivocal (score 2+), for FISH testing.
- Ki-67 proliferation index 50% of tumor cells

## Case Resume

### مفيدة أسامة عمر

46 yrs, DM, premenopausal, P.S. (ECOG): 1

Presented on 1/2023 with locally advanced breast with peau d'orange

1/23: Breast biopsy + positive axillary biopsy : IDC , GII , ER(8/8) , PR(7/8) , HER2 +2 SISH -ve , KI 50%

CT chest mild pleural effusion

CT abdomen: HFL 1 cm >> proven benign by MRI

PET CT 2/23: RT breast lesions , RT axillary LNs , few lytic osseous lesions likely metastatic ( ribs RT side , LV1 , Lt iliac bone ) , moderate to marked RT pleural effusion , no liver lesions

Pleural effusion cytology: high atypical suspicious cells

3/23 FEMARA/ ZOLADEX with good clinical and radiological response >> resolution of pleural effusion and axillary LNs, SD breast

2/25 >>> CA15.3 133 vs 44 (8/24)

CT chest & PA compared to 2/24:

- PD of rt breast mass lesions as well as satellites
- De novo encysted RT pleural effusion as well as apical lung lobe nodule and RT para tracheal adenopathy
- De novo few round glass opacities
- SD HFL >> proven before benign by MRI
- Moderate hydronephrosis >> obstructing large renal ureteric stone
- SD of lt bulky ovary
- SD scattered bone lesions, dorsal, lumbar vertebrae, rt lower ribs

BONE SCAN: newly developed foci at cervicodorsal spine, 12th dorsal vertebrae, Lt. sacroiliac joint suspecting early bone mets

### Committee decision on 13/2/25:

- FOR UROLOGY CONSULTATION ABOUT THE STONE TO AVOID RENAL AFFECTION
- CONTINUE SAME TTT AS MINIMAL PD

Continued the same ttt...

### CT Chest on 4/5/25 compared to 28/1/25:

- PD of breast lesion (50\*48 mm vs. 39\*38 mm)
- SD of satellite lesions, largest 39\*30 mm
- PD of Rt. axillary LN's (31\*21 mm vs. 20\*20 mm)
- CR of Rt upper lung lobe apical nodule
- SD of mild encysted Rt. encysted pleural effusion
- PD of Rt. paratracheal LN's, largest 24\*21 mm

### CT abdomen & pelvis on 4/5/25 compared to 28/1/25:

- SD of the HFL, atrophic malrotated RT kidney, moderate hydronephrosis due to stone , SD of bone sclerotic lesions

### Decision of the oncology committee at EgyptAir Hospital on 18/5/2025:

- For palliative RTH to the RT breast as skin nodules
- For Faslodex / CDK4/6 inhibitor + Zometa (will be received in HARMEL)

Patient Name : مفيدة اسامه عمر محمد

Age : 44 Y : 4 M : 1 D

Referred By Prof. Dr. : محمد عبد الله

Clinical Diagnosis : Breast mass

Nature of Specimen : Referred block labelled as 58/23 (Core biopsies)

Receiving Date : 2023-02-02

Analysis ID : 722694

Gender : Female

Patient ID : 555273

## IMMUNOHISTOCHEMISTRY REPORT

### Technique :

Sections prepared from the paraffin block were stained for HER 2 gene and chromosome 17 using Silver In Situ Hybridization (SISH) technique in Benchmark XT (Ventana).

### Results :

The ratio of Her 2 signals to chromosome 17 signals in the nuclei of the tumour cells is 1.5 (less than 2) indicating absence of amplification of HER2 gene.  
Average Her 2 copy nb/cell is 3.

### Conclusion :

Referred block, HER 2 by SISH, NEGATIVE FOR HER 2 GENE AMPLIFICATION, RATIO IS 1.5.

### CT SCAN OF THE ABDOMEN AND PELVIS

**HISTORY:** A known case with right breast cancer on follow up. Compared to the last available previous study dated 23/04/2026, the current study reveals:

#### TECHNIQUE:

Axial contiguous cuts were taken through the abdomen and pelvis with oral and IV contrast injection.

#### FINDINGS:

- The liver is enlarged in size displaying diffuse decreased attenuation pattern, denoting diffuse fatty infiltration. Stationary course is noted regarding the size of the hepatic segment VIII focal lesion still = 16 x 15 mm, no other hepatic focal lesions noted.
- No extra or intrahepatic biliary dilatation.
- The PV: is of average diameter with normal contrast opacification with no CT evidence of internal thrombosis.
- The spleen is of average size displaying normal and homogeneous CT appearance.
- The pancreas shows normal C.T. appearance.
- The right kidney is still atrophic displaying small size being malrotated with thinned renal parenchyma still showing small size stones as well as moderate hydronephrosis due to a large renal pelvic / upper ureteric stone = 17 x 16 mm.
- The left kidney is seen in its normal anatomical site displaying average size and normal shape (malrotated). No evidence of abnormal masses or backpressure changes.
- Normal size and CT density of the adrenal glands.
- No sizable abdominal or pelvic adenopathy.
- No evidence of ascites.
- Normal appearance of the urinary bladder with normal wall thickness and no calculi, masses or diverticula.
- Normal CT appearance of the uterus and both adnexal regions apart from stationary course regarding the bulky size of the left ovary.
- Normal CT appearance of the scanned bowel loops.
- No pelvic masses or fluid collection.
- With stationary course, bone window reveals extensive widespread lytic and sclerotic lesions involving the whole scanned spine, sternum, pelvic bone, and proximal parts of the femoral bones.

#### IMPRESSION:

- A follow up study reveals stationary course regarding the size of the hepatic segment VIII hypodense focal lesion.
- Stationary course regarding the fatty hepatomegaly.
- Stationary course regarding the Small-sized right kidney, being malrotated with an obstructing pelvic stone and a subsequent moderate hydronephrosis and thinned renal parenchyma.
- Stationary course regarding the widespread lytic and sclerotic lesions involving the whole scanned spine, sternum, pelvic bone and proximal parts of the femoral bones, consistent with bone metastases.

*Much obliged,*

### CT SCAN OF THE CHEST

**HISTORY:** A known case with right breast cancer on follow up. Compared to the last available previous study dated 23/04/2026, the current study reveals:

**TECHNIQUE:**

Axial contiguous cuts were taken through the abdomen and pelvis with oral and IV contrast injection.

**FINDINGS:**

- Stationary course regarding the abdominal irregular right-sided circumferential pleural thickening, reaching the maximum at the para-vertebral region (20 mm) associated with minimal right-sided pleural effusion.
- Stationary course regarding the right upper lobe anterior and right middle lobe peripheral reticular infiltration and fibrosis with underlying fibro-atelectatic bands.
- Progressive course regarding the right lower lobe scattered atelectatic bands and septal thickening.
- Progressive course regarding the right breast skin thickening and edema with an irregular speculated soft tissue mass lesion currently = 45 x 38 mm compared to 50 x 48 mm in average on the previous study.
- Progressive course regarding a few small-sized right paratracheal and subcarinal lymphadenopathies, with the largest = 12 x 10 mm.
- No evidence of abnormal masses, nodules or consolidative patches.
- Normal CT appearance of the mediastinum vessels.
- Patent tracheobronchial tree with no abdominal bronchial dilatation.
- No left-sided pleural or pericardial effusion.
- Normal cardiac borders and chambers.

**IMPRESSION:**

- Allow up study reveals progressive course regarding the size of the right breast malignant looking mass lesions as well as the size of the right axillary malignant looking lymphadenopathies and the right paratracheal lymphadenopathies.
- A stationary course regarding the right breast satellite lesions and encysted right side plural effusion.
- Stationary course regarding the pulmonary atelectatic bands.
- Complete resolution of the right upper lobe pulmonary changes.

*Much obliged,*

## Nuclear Medicine Report

|        |                           |                |
|--------|---------------------------|----------------|
| Name:  | السيادة / مفيدة اسامة عمر | Age: 48 yrs    |
| Date : | 16 / 9 / 2026             | Code: 01284324 |

Tc-99m MDP Bone Scan

In comparison to previous scan on 19/4/2026 (5 months)

- ❖ *Metastatic bone deposits are re-evaluated at following skeletal sites:*

1. Skull calvarium → foci are increased in size & number → **new lesions**
2. Manubrium sterni → enhanced → increase in size and density
3. Cervical & upper dorsal spines → re-enhanced
4. Lt shoulder → decrease in count → improved
5. Inferior angle of Lt scapula → same
6. Multiple rib lesions on both sides posteriorly → **new**
7. Mid dorsal vertebrae → **new**
8. L2 & L3 → the same while L4 & L5 → **new**
9. Both SI joints → enhanced with higher count density
10. Both acetabulums, Rt ischium & Lt ASIS → **new**
11. Rt femoral neck → enhanced with increase in size
12. Rt femoral shaft → faint **new** foci

- ❖ *Progressive disease course is impressed by enhancement in most of lesions and appearance of new sites. Clinical correlation is recommended.*

- ❖ Rt ankle arthritis is observed in present scan, to revise clinical data.
- ❖ Rt breast edema is still massive with dense soft tissue count.
- ❖ Rt kidney is atrophied & ptosed.

## Comments :-

Mild macrocytosis. Vitamin B12 or folic acid trial therapy is recommended.  
Mild leucopenia with absolute neutropenia and lymphopenia. for clinical correlation.
