Reason for Order:
Surgical Pathology Exam

Type of Request :
Regular
Side of Procedure Done:
Right

Clinical Information

RT breast malignant looking BIRADS5 mass lesion.

Gross Picture

4 cores 1-1.5 cm.

Microscopic Picture

A case of invasive duct carcinoma, grade III. No DCIS component nor lymphovascular emboli were detected. Foci of necrosis are seen. Stroma is desmoplastic with mild inflammatory cell reaction.

Diagnostic Summary

Tumour type:
Invasive duct carcinoma, grade III.
Laterality
Right
Specimen type:
U/S guided Tru-cut biopsy.

ننشرف بأن نوضح فيما يلي تقريراً عن حالته		
	تاريخ وساعة الخروج :	تاريخ وساعة الدخول :
وبعد الكشف والفحوصات والمتابعة وجد انه		
The patient is a 45-year-old female with triple-positive invasive ductal carcinoma (IDC) of the breast, estrogen receptor (ER) 5/8 and progesterone receptor (PR) 3/8. She received eight cycles of adjuvant chemotherapy consisting of four cycles of doxorubicin/cyclophosphamide (AC) followed by four cycles of docetaxel (taxotere) and a phesgo regimen. Subsequent to chemotherapy, she underwent breast conserving surgery (BCS) in August 2024 and received adjuvant radiotherapy (RT). She was then treated with KADCYLA (trastuzumab deruxtecan) for 12 cycles, with a port in place, and continued on Zoladex (goserelin) and Femara (letrozole). She is currently scheduled to continue Zoladex and Femara for an additional three months. The patient is undergoing a new annual evaluation for a thyroid nodule classified as TIRADS IV. She has had a fine-needle aspiration cytology (FNAC) performed, and the results are pending. She is continuing her hormonal therapy with Zoladex and Femara, with a plan to reassess after three months. The patient is currently receiving Zoladex and Femara with a planned duration of three months, with the next visit scheduled after this period.

Pathology Report

Clinical Data: Right breast cancer (post NACT) .
Nature of the specimen: Slide revision.

Gross Examination:

- 1 paraffin block and 13 slides were received.

Microscopic examination:

- Histological type: Residual viable tumor tissue detected (<1mm).
- Ductal carcinoma in situ: No
- Skin involvement: Free nipple and areola
- Lymph node involvement: Free L.Ns (0/18).
- Resection Margins: Free margins
- Histologic response to therapy: Pathologic near Complete response

Diagnosis:

Right breast cancer (post NACT) :

- Residual viable tumor tissue detected (<1mm).
- No DCIS.
- Free margins
- Free nipple and areola
- Free L.Ns (0/18)
- Pathologic near complete Response
- Stage : ypT1mi , ypN0

Report:

**POST CONTRAST MULTI-SLICE CT SCAN OF THE NECK,
CHEST, ABDOMEN AND PELVIS****1-NECK:**

- Normal appearance of the nasopharynx, oropharyngeal and laryngeal air spaces.
- No glottic, supra or infra glottic mass lesions.
- Intact cartilaginous skeleton of the larynx.
- Normal appearance of submandibular, parotid salivary glands.
- No neck soft tissue mass lesions.
- Two right thyroid lobe iso and hypodense nodules the larger measuring 13 X 12 mm.
- Normal appearance of the neck muscles & vessels.
- No pathologically enlarged cervical lymph nodes.
- Variable degrees of mild pansinusitis sparing the frontal sinus.
- Prominent right supraclavicular lymph node measuring 8 X 5 mm.

2- CHEST:

- Right breast upper aspect irregular spiculated mass lesion with central cystic degeneration, it is measuring 29 X 27 mm.
- Prominent right axillary level I and II lymph nodes; the largest seen at level I measuring 20x10 mm in axial dimensions.
- Enlarged right internal mammary lymph nodes, the largest measures 17 X 6 mm.
- Few bilateral scattered pulmonary nodules with some of them show internal calcification mostly representing post granulomatous sequel.
- No pathological hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

3- ABDOMEN AND PELVIS:

PATIENT: Birlinti ALI KALW HABEB, 20224005768, Female, 43 y

Date: 2026-09-15

Referred by: Prof.Dr. no doctor

Hospital: Goustave Roussey International Egypt

MULTI-SLICE POST CONTRAST AXIAL CT SCAN OF THE CHEST AND ABDOMEN REVEALED:

Known case of right breast cancer underwent CBS on follow up.
Chest findings

- Bilateral basal calcified pulmonary nodules ...likely Old granuloma.
- Middle lobe subsegmental collapse of the lateral segment with air bronchogram.
- No detected suspicious pulmonary nodules or masses.
- Normal central trachea with no lesions inside. Normal main bronchi.
- Normal both hilar region. No hilar masses or lymphadenopathy.
- Clear pleural surfaces with no evidence of pleural effusion.
- Normal cardiac size, no pericardial effusion.

Abdomen and pelvis findings

- Mild enlarged fatty liver. No definite enhancing focal lesions lesions.
- No dilated intra-hepatic biliary radicles.
- Normal caliber patent Portal Vein
- Partially contracted gallbladder. Few small hyperdense stones inside.
- Normal size, shape and parenchymal density of the pancreas. No enhancing lesions.
- Normal size, shape and density of the spleen. No focal lesions.
- Normal size, and contrast excretion by both kidneys. Normal parenchymal thickness. No renal, masses stones or back pressure changes.
- Normal both supra-renal glands, no masses.
- No ascites
- Normal aorta, I.V.C.
- Normal filling of the urinary bladder with smooth inner surface and uniform wall thickness.
- Degenerative changes of the scanned bones, No aggressive bony lesions.

CONCLUSION:

- No detected suspicious pulmonary or hepatic deposits.

Dr, Ibrahim El Gaml, MD
