5 greyish white tissue cores; 1.2 cm long each, totally submitted.

Microscopic Examination:

Histopathological examination of sections prepared from the lumpectomy specimen received reveals an infiltrating malignant epithelial growth. The tumour is made up of groups and small sheets of pleomorphic hyperchromatic malignant ductal epithelial cells. Stromal desmoplasia is moderate. Cellular and nuclear atypia are moderate. Foci show DCIS solid and comedo.

Diagnosis:

Left breast retro-areolar mass, core biopsy;

Invasive duct carcinoma GII, in situ cribriform and comedo, for IPT;
(ER, PR, Her2 & Ki67).

^{99m}Tc MDP Bone Scan Report (11/3/2024)

* Whole Body, Anterior and Posterior Planar Views Acquired 2Hrs. Post I.V Injection of 20mCi of ^{99m}Tc MDP
Revealed:

- Linear tracer uptake at LV3 likely porotic collapse for radiological correlation.
- Otherwise, no definite evidence of active osseous deposits could be seen over the surveyed skeleton.
- Degenerative changes are noted over the dorso-lumbar vertebrae.
- Arthritic changes are noted over both shoulder and both knee joints.
- Both kidneys are visualized.

Conclusion:

- Linear tracer uptake at LV3 likely porotic collapse for radiological correlation.
- Otherwise, no definite evidence of active metastatic osseous deposits could be seen all over the surveyed skeleton.
