Bilateral Full field Digital Mammography

Clinical summary: 62 year old lady with negative family history complaining of right breast lump of two days duration.

Technique

Medio-lateral oblique and CC views. High resolution ultrasound

Detailed findings

Right breast

- Almost entirely fatty breast parenchyma (ACR density a)
- Lower central posterior third irregular speculated high density mass lesion with surrounding distortion.
- No asymmetric densities, suspicious clusters of micro calcifications.
- Ultrasound demonstrated 5-6 o'clock, 3 cm from nipple, 3 mm deep to the skin, irregular anti-parallel speculated heterogeneous solid mass lesion with posterior acoustic shadowing and mild internal vascularity on color Doppler study measuring 2.8 x 2.3 cm (mammography correlate)
- No solid or cystic lesion.
- Normal skin/subcutaneous tissue and nipple/areolar complex.
- Non-specific axillary LNs.

Left breast

- Almost entirely fatty breast parenchyma (ACR density a).
- No masses, asymmetric densities, distortion or suspicious clusters of micro calcifications.
- Ultrasound demonstrated normal parenchyma
- No solid or cystic lesion.
- Normal skin/subcutaneous tissue and nipple/areolar complex.
- Non-specific axillary LNs.

Impression:

Right breast (BIRADS 5): lower central suspicious solid mass lesion.

Left breast (BIRADS 1): Normal study.

Recommendations:

Right breast: US guided Tru-cut biopsy and histopathological correlation.

Left breast: Annual screening mammogram
