| وبعد الكشف والفحوصات والمتابعة وجد انه<br><b>Breast cancer on hormonal therapy with Zometa and Femara; bone scan on 24/1/2026 was free of disease.</b><br><b>Today, 1/6/2026, the patient received Femara 2.5 mg and supportive therapy, with a plan for a 3-month pharmacy refill.</b><br><b>The patient is a 53-year-old female with hypertension, invasive ductal carcinoma Grade II, ER 7/8, PR 6/8, HER2 negative, clinical stage T2 N1 M0. She received neoadjuvant chemotherapy with 3 cycles of AC and 12 cycles of Taxol. She underwent left breast conserving surgery in July 2022, followed by post-operative radiotherapy to the chest wall and axilla (TPT2 N3). Tamoxifen was started in August 2022 and was switched to an aromatase inhibitor in August 2023. Zometa is due on 30/7/2026 (day-care pharmacy). Labs for Femara were obtained today and a 3-month pharmacy refill was arranged.</b><br><b>CT chest with contrast performed in August 2026, compared to 2022, revealed a new non-enhancing focal lesion in the upper pole of the spleen measuring 13 × 9 mm, and new tiny lytic lesions at L2 and L4. A bone scan and tumor markers were ordered, and the patient was re-consulted while continuing Femara.</b> |                       |                                                                                     |

### IMMUNOHISTOCHEMISTRY REPORT

Clinical Data:  
Lt breast mass

Nature of the specimen:  
Tru cut biopsy

#### Gross Examination:

Four gray white tissue cores up to 1.5cm, totally submitted. Sections prepared from paraffin block for immune- staining using Bench Mark ULTRA system for ER, PR, HER2, ER clone (1E2), PR clone (SP1), HER-2 clone (4B5), & Ki67 clone (30-9)

#### Microscopic examination:

- Histological type: IDC
- Grade II
- Angioinvasion: no
- Ductal carcinoma in situ: positive

#### Diagnosis:

Lt breast mass, tru cut biopsy:

Invaive duct carcinoma GII

#### Biomarkers:

ER: Strong nuclear reaction in 50% of tumor cells (Allred score 7/8)

PR: Strong nuclear reaction in 35% of tumor cells (Allred score 6/8)

Her-2: Negative membrane reaction in tumor cells (score 0)

Ki 67: 10 % nuclear reaction

**POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN & PELVIS REVEALED: -**

**1. Chest:**

- Left breast UIQ speculated lesion is seen measuring about 3x2.5 cm.
- Few left axillary enlarged lymph nodes., the largest measures 2.5x1.5 cm.
- Clear both lung fields .
- No sizable pulmonary masses, areas of consolidation or cavitary lesions.
- No hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.
- Normal appearance of the chest wall.
- Normal appearance of the dorsal vertebrae.

**2. Abdomen and pelvis:**

- The liver is enlarged in size with homogenous low (fatty) CT texture. No focal lesions or contour irregularities.
- Patent homogeneously enhancing portal vein and its main branches as well as its main tributaries.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, aorta, I.V.C and both suprarenals.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.
- No lytic or sclerotic bone lesions.

**OPINION:**

- **Left breast neoplastic lesion with few left axillary pathologically enlarged lymph nodes.**
- **No evidence of pulmonary or hepatic metastasis.**

**MULTISCLICE POST CONTRAST C.T. EXAMINATION OF THE CHEST, ABDOMEN AND PELVIS REVEALED:**

Axial contiguous thin cuts were taken through the chest, abdomen and pelvis after I.V. contrast injection.

**A known case of managed left breast cancer, with no available clinical data, as compared to the last CT report dated 4/1/2022, the current examination revealed**

**I- CHEST:**

- Left upper subpleural fine reticulation likely post radiation sequel.
- Bilateral basal atelectatic bands are noted
- No pulmonary nodules, masses or cavitary lesions.
- No hilar or mediastinal masses or lymph node enlargement.
- No pleural or pericardial collection.
- Normal plain CT appearance of the heart and great vessels.

**II- ABDOMEN AND PELVIS:**

- Average sized liver showing homogenous fatty parenchymal attenuation. No hepatic focal lesion or dilated biliary radicles.
- The gall bladder is well distended, average wall thickness with no stones.
- Both kidneys are normal site, average sized and showing smooth regular cortical outline and preserved parenchymal thickness and function. No stones or back pressure changes.
- Average size spleen with Newly developed upper pole hypodense/non enhanced focal lesion measures about 13x9 mm in its maximum axial dimensions
- Normal C.T appearance of the pancreas, suprarenal glands, aorta and IVC.
- The urinary bladder shows no evidence of gross masses or diverticula or stones.
- Normal appearance of the pelvic organs with no pelvic masses or collections. IUD is noted
- No abdominal or pelvic lymphadenopathy.
- No ascites.
- The examined skeleton Newly developed small L2 and L4 lytic lesions

**Opinion:**

- Left upper subpleural fine reticulation likely post radiation sequel.
- Bilateral basal atelectatic bands.
- Fatty liver
- Upper splenic pole hypodense/non enhanced focal lesion.
- L2, L4 tiny lytic lesion for further bone scan.

## NUCLEAR MEDICINE WHOLE BODY BONE SCINTIGRAPHY REPORT

**Clinical Indication:** Evaluation for skeletal metastatic disease in a 54-year-old female with left breast carcinoma, post-surgery, chemotherapy, and radiotherapy, on hormonal therapy. Recent CT (August 04, 2026) reported newly developed small lytic lesions at L2 and L4.

**Procedure:** Anterior and posterior whole-body planar radionuclide bone scintigrams were acquired approximately 3 hours after intravenous Tc-99m MDP administration.

### Findings:

- Mild focal radiotracer enhancement is noted at the right lateral aspect of the L4 vertebra. Subtle inconclusive enhancement is noted at the right ischium.
- Symmetrical tracer uptake is seen throughout the remainder of the calvarium, cervical and thoracic spine, ribs, sternum, and pelvis. Symmetrical tracer distribution is noted throughout the long bones, with mild penarticular uptake at the weight-bearing joints. Normal physiological bilateral renal clearance with expected bladder collection.

### Impression:

- Equivocal uptake pattern at the right aspect of L4 as well as subtle inconclusive uptake at the right ischium, for more radiological assessment to rule in/out the possibility of metastasis.
- No other scintigraphic evidence of focal osteoblastic skeletal metastatic disease.

Dr. Alaa Nagi, MD Nuclear Medicine
