وبعد الكشف والفحوصات والمتابعة وجد انه The patient is a 49-year-old with a primary left-breast carcinoma, initially staged as clinical T4B N2 M0 with estrogen-receptor expression 6/8, progesterone-receptor expression 7/8, and HER2-positive disease (3+). The patient underwent left modified radical mastectomy on 11/2/2025 and subsequently received adjuvant therapy consisting of KADCYLA 260 mg and FEMORA beginning in March 2025 for a planned C12 regimen. The patient was prescribed FEMORA calcium 1 tablet daily for 90 days, along with ONE ALPHA ZOLAEX 10.8 mg subcutaneously as a single dose in January 2026, with the medication provided free for CT CAP. The patient reports new onset trigeminal neuralgia; magnetic resonance imaging of the brain was ordered to evaluate this symptom while the patient continues on FEMORA and ZOLADEX for a duration of three months. The current plan is to assess imaging results and manage the neuralgia accordingly.
