ننشرف بأن نوضح فيما يلي تقريراً عن حالتها	
تاريخ وساعة الدخول :	تاريخ وساعة الخروج :
وبعد الكشف والفحوصات والمتابعة وجد انها The patient is a 53-year-old with a history of right-sided breast cancer, clinical stage T4 N1 M0, grade 3, triple-negative phenotype, status post-mastectomy (REC 4). The current adjuvant regimen consists of weekly Taxol 130 mg and Carboplatin dosed to AUC 5, initiated in week 6 of therapy. On examination, a right upper outer quadrant mass measuring approximately 4 × 5 cm was noted. The patient presented for administration of week 7 Taxol 130 mg and Carboplatin 200 mg (AUC 2). A single dose of G-CSF was supplied for the upcoming week 8 and week 9 complete blood count monitoring, and the pharmacy processed the order accordingly. Pharmacy documentation confirmed that week 8 treatment was scheduled with Taxol plus Carboplatin at AUC 2. The daycare pharmacy recorded that week 9 treatment would consist of Taxol 130 mg and Carboplatin at AUC 2, to be administered at the next clinic visit. Clinical pharmacy services noted a delay in the week 10 visit due to Ministry of Health approval issues. The plan was to give Taxol 130 mg and Carboplatin (AUC 2) 220 mg at the upcoming clinic appointment, with new laboratory studies to be obtained. During the clinical pharmacy encounter, the patient's total leukocyte count was $2 \times 10^9/L$ and neutrophil count $1.2 \times 10^9/L$; prophylactic Neupogen was prescribed. The current plan is to proceed with the scheduled week 10 Taxol and Carboplatin administration pending lab results and approval.

Patient Name: Safaa Ahmed El-Badawy Abd Al Gaber Abu Taleb	Date : 27/07/2025
Exam : CT CAP+C (CT Chest Abd. Pelvis)	Age : 52 Year(s)
Medical ID: 1900/2025	Pat. ID: 100065

MULTISLICE POST CONTRAST C.T. EXAMINATION OF THE CHEST, ABDOMEN AND PELVIS REVEALED:

I- CHEST:

- Right breast rather well-defined enhancing lesion measuring 4.5 x 3.3 cm is noted.
- Multiple right axillary pathologically enlarged lymph nodes are noted largest measuring 3.7 x 2.7 cm.
- No pulmonary nodules, masses or cavitory lesions.
- No consolidation or collapse.
- No hilar or mediastinal masses or pathological lymph node enlargement.
- No pleural or pericardial collection.
- Normal plain CT appearance of the heart and great vessels.

II- ABDOMEN AND PELVIS:

- Average sized liver showing few left hepatic lobe hypodense non enhancing focal lesions largest measuring 1 x 1 cm at segment 2.
- No dilated biliary radicles.
- Both kidneys are normal size, average sized and showing smooth regular cortical outline and preserved parenchymal thickness and function. No stones or back pressure changes.
- Normal C.T appearance of the spleen, pancreas, suprarenal glands, aorta and IVC.
- The urinary bladder shows no evidence of gross masses or diverticulae or stones.
- No pelvic masses.
- No abdominal or pelvic pathological lymphadenopathy.
- No ascites.

Opinion:

- ❖ Right breast lesion as described, for sonomammographic & histopathological correlation.
- ❖ Multiple right axillary pathological lymph nodes for histopathological correlation.
- ❖ Left hepatic lobe focal lesions for Triphasic CT/Dynamic MRI

Patient Name: Safaa Ahmed El-Badawy Abd Al Gaber Abu Taleb	Date : 27/07/2025

Patient Name: Safaa Ahmed El-Badawy Abd Al	Date : 14/06/2025
Abu Taleb	
Exam : MAMMOGRAPHY BOTH	Age : 52 Year(s)
Medical ID :	Pat. ID: 100065

BILATERAL MAMMOGRAM AND BREAST ULTRASONOGRAPHY REVEALED:

- Breast density: Moderate dense breast tissue...Matching ACR C.
- Thickened right breast skin associated with focal asymmetry in the right upper outer quadrant and irregular shaped mass.
- No detected suspicious mass density, architectural distortion or pathological micro-calcification in the left breast.
- Normal skin and nipple on the left side.

Complementary breast ultrasound:

- Homogenous (predominantly glandular) echo-texture of both breasts.
- Corresponding to the mammographic findings: An irregular shaped non-circumscribed hyperechoic mass is seen in the right breast at 11-12 o'clock position, zone 1, it measures (2.5 x 1.6 cm) associated with large area of dense heterogeneously enhancing parenchyma extending in between 10-12 oclock position, zone 1.
- Thickened right breast skin (6 mm).
- Normal left skin and nipple.
- No detected suspicious solid or cystic masses in the left breast.
- few (at least 3 in number) suspicious looking level 2 right axillary LN measuring 2.6 x 1.8 cm.
- No detected significant left axillary LNs.

IMPRESSION:

- Right breast: UOQ highly suspicious multifocal malignant process, considering the extreme dense breast contrast study is recommended to delineate the Actual extent BIRADS 5 category.
- Left breast: normal BIRADS 1 Category.

RECOMMENDATION:

Dr/MONA ZAKY, MD.

Chief of diagnostic radiology-breast imaging unit -Mansoura university

Pathology Report

Clinical Data
Right breast mass

Nature of specimen
Tru cut biopsy, collected at 17/6/2025, 10:30 am

Gross examination

Multiple grayish white tissue cores up to 1 cm, totally submitted.

IHC technique: Sections prepared from paraffin block for immune-staining using Bench Mark ULTRA system for ER, PR, HER2, ER clone (1E2), PR clone (SP1), HER-2 clone (4B5), & Ki67 clone (30-9).

Microscopic examination

- * Histological type: Invasive duct carcinoma
- * Grade (differentiation +nuclear pleomorphism+ mitosis): (3+3+2) Grade III
- * DCIS: No
- * Angioinvasion: Couldn't be detected in the received biopsy
- * Perineural invasion: No
- * IPT (Positive control showed appropriate reactivity) :
- * ER: No nuclear reaction in tumor cells (Allred score 0/8)
- * PR: Weak nuclear reaction in <1 % tumor cells (Allred score 2/8)
- * HER2: Moderate complete membrane reaction in>10 % of tumor cells (score 2+)
- * SISH :Average Her2 copy No .3.7 , HER2/CEP17 ratio :1.2
- * Ki 67: 60 % nuclear reaction of tumor cells

Pathology Report

Right breast mass, Tru cut biopsy:
Invasive duct carcinoma, Grade III
IPT:

- * ER: Negative (score 0/8).
- * PR: Negative (score 2/8).
- * HER2: Equivocal (score 2+).
- * SISH : Not amplified
- * Ki67: Positive in 60% of tumor cells.

Report Date: 20/10/2025 05:22:51 PM	Age: 53 Years, 9 Months, 20 Days

MRI EXAMINATION OF THE ABDOMEN AND PELVIS

Technique:

- Axial T1 (in and opposed phases), T1 fat-sat, T2 & DWI
- Coronal and sagittal T2 WI
- Dynamic post-contrast series

Findings:

A reported case of breast cancer;

- Average sized liver showing smooth outlines and homogeneous parenchymal signal and enhancement. Few bilobar hepatic cysts are seen displaying low T1 and high T2 signals with no diffusion restriction or post-contrast enhancement – largest is seen in segment IVa/II measuring 12 mm.
- Patent homogeneously opacified portal vein and its main branches.
- Prominent CBD and central intrahepatic bile ducts are noted.
- The gall bladder show no calcular filling defects. Focal fundal adenomyomatosis is suggested.
- Normal MRI appearance of the spleen, pancreas, adrenal glands, kidneys (apart from bilateral small cortical cysts), aorta and IVC.
- The urinary bladder shows no gross masses, calcular filling defects or diverticulae.
- Bulky uterus with diffusely thickened junctional zone in keeping with diffuse adenomyosis. A small fundal intra-mural fibroid measuring 16 mm is seen. Small cervical Nabothian cyst is noted.
- No adnexal masses or sizable cystic lesions.
- No pathologically enlarged abdominal or pelvic lymph nodes.
- No ascites.
- Small midline anterior abdominal wall hernia containing fat is seen supra-umbilical in location.

OPINION:

- Few bilobar hepatic cysts as above detailed
- No metastatic abdomino-pelvic lesions appreciated
