POST-CONTRAST MRI STUDY OF THE BRAIN

❖ TECHNIQUE:-

- *Plate 1-3: Axial T1, T2WIs & FLAIR*
- *Plate 4: Coronal T2 and sagittal T1WI.*
- *Plate 5: DWIs and ADC mapping.*
- *Post-contrast series.*

❖ FINDINGS:

- **Bilateral cerebral cortical and subcortical gray/ white matter interface multiple well-defined intra-axial cystic S.O.Ls are seen, the largest seen at the left temporal region measuring about 4.3x2.8x3cm cm along its maximum axial and CC dimensions respectively, elicits intermediate to low T1 / FLAIR and heterogenous high T2 signals showing marginal post-contrast enhancement.**
- **These lesions are surrounded by moderate vasogenic edema; together exert mass effect in the form of effacement of the adjacent cortical sulci and compression of related parts of both lateral ventricles and mild midline shift to the right about 4mm.**
- **Other similar but smaller SOLs are seen at bilateral cerebellar hemispheres.**
- No brain stem areas of abnormal MRI signal intensity.
- No intra or extra axial collections.

❖ OPINION:

- ***Bilateral cerebral and cerebellar well-defined intra-axial S.O.Ls with vasogenic edema causing mass effect as described, metastatic deposits is first to be considered rather than inflammatory with abscesses formation, for clinical correlation and MR spectroscopic assessment.***

Much Obliged, Yours

Detailed Medical Report

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من		**بشأن تقرير طبي للمريض**	
بقسم:		**رقم طبي:**	

ننشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول :		**تاريخ وساعة الخروج :**	

وبعد الكشف والفحوصات والمتابعة وجد انه

The patient has a history of bilateral breast cancer diagnosed in 2024, for which neoadjuvant chemotherapy with the TCHP regimen was administered. Follow-up was missed after May 2024 and no surgical intervention was performed. On the current presentation, brain MRI demonstrated bilateral cerebellar and cerebral well-defined intra-axial lesions measuring 4.3 × 2.8 × 3 cm, associated with vasogenic edema and mass effect, consistent with metastatic deposits. The patient is receiving dehydration measures. Physical examination revealed a right-sided breast mass that is locally advanced, with a positive range and retracted nipple, and a left-sided breast mass measuring approximately 3 × 2 cm; no axillary lymphadenopathy was noted. The plan includes a new work-up with contrast-enhanced CT of the chest, abdomen, and pelvis, as well as bilateral breast ultrasound.

Pathology Report
[[DOCTYPE:PATHOLOGY_REPORT]]

Patient Name: فردوس محمد البلاط

Report Date: 23/12/2023

Ref. Phy.:

Echo Doppler study

Measurements:

AO root	3.0cm	LVEDD	5.3cm
LA	3.9cm	LVESD	3.5cm
IVS	0.9cm	EF%	63%
LVPW	0.9cm	RV	1.2cm

Comment:

- Normal LV internal dimensions with good LV systolic function.
- Left ventricular diastolic dysfunction (grade II).
- No RWMA can be detected at rest.
- Normal mitral valve structure.
- Normal aortic valve structure and flow signal
- Normal LA dimension.
- Normal RV dimension with preserved systolic function (TAPSE=23mm) with mild TR of normal valve with normal PASP.
- Normal IVC diameter and collapse.
- Intact IAS and IVS by TTE.
- Normal pericardium.
- No intra_cavitary thrombi or masses by TTE.

Conclusion:

❖ **Left ventricular diastolic dysfunction.**

Best Regards,

Dr. Shaimaa Mostafa (MD)

Report:

99MTC-MDP BONE SCAN

Desired Information: -
skeletal survey.

Technique:
Delayed Whole body imaging in anterior and posterior projection performed 2 hours after I.V administration of 20 mCi 99m Tc-MDP in the following manner:

Report:

No hot spot that account for osseous deposits could be detected allover the surveyed skeleton.
Degenerative changes are seen over dorso-lumbar vertebrae.
Arthritic changes are seen over both knees.
Both kidneys are normally visualized.

Conclusion:

No definite evidence of metastatic osseous deposits.

Patient Name: Fardos Mohamed Mohamed Alballat	Date : 11/08/2024
Exam : MRI RIGHT KNEE	Age : 60 Year(s)
Medical ID: 4389/2023	Pat. ID: 48698

MRI OF THE RIGHT KNEE JOINT

Technique of examination:

- Sagittal T1, PD & T2 WIs
- Axial T2 Wis.
- Coronal STIR WIs.

MRI Findings:

- Maintained tibiofemoral and patellofemoral joints articular relations
- Osteoarthritic knee changes are seen with narrowed tibiofemoral joint space more at lateral aspect with subchondral degenerative changes of opposing articular surfaces, marginal tibial and femoral condylar osteophytic lippings with bipolar patellar lippings
- Triangular intermediate signal is seen within the posterior horn of the medial meniscus not reaching its articular surfaces.
- Normal configuration and MR signal of the lateral meniscus
- Elevated signal of ACL fibers with intact fibers continuity
- Normal MRI appearance of the PCL, collateral ligaments, quadriceps tendon and infrapatellar ligament.
- Mid knee joint effusion is noted.
- Large septated multi-locular baker cyst seen with minimal fluid signal caudal to it.
- Intact peri-articular musculature with preserved intervening fat planes.

Opinion:

- Osteoarthritic knee changes
- Degenerated posterior horn medial meniscus.
- ACL sprain
- Mild knee joint effusion with picture suggestive of leaking Baker's cyst

Contrast enhanced Spectral Mammography

CLINICAL SUMMARY: A case of right invasive duct carcinoma and left invasive lobular carcinoma

CC & MLO low energy & recombined (post contrast) images

FINDINGS:

Background Uptake: minimal background enhancement

ACR: b (scattered fibro-glandular densities)

Right BREAST:

- **Low energy (Non contrast) images**: Diffuse pathological process seen inform of asymmetrical density , distortion with overlying malignant microcalcifications , the process is more evident in the upper quadrants and centrally .
- Diffuse skin thickness
- **Recombined (Post contrast) images**: Diffuse heterogeneous moderate non mass enhancement seen involve most of the breast parenchyma , more evident in the upper quadrants , it is seen located 1.2 cm from the nipple and measures 13x12.7x10cm . **(this corresponding to the calcifications coverage area).**
- **Complementary US**:
- Pathologically enlarged level I lymph nodes, (more than 3 in number) all are discrete , globular in shape with lost hilum, the largest is25mm in diameter.

Left BREAST:

- **Low energy (Non contrast) images**
  1. UIQ deeply seated area of distortion.
  2. UOQ two circumscribed middle and anterior third isodense oval lesions, the largest shows few calcific foci within
  3. Area of grouped punctated microcalcifications bout 6mm in diameter located at about 6.5cm from the nipple
- **Recombined (Post contrast) images**
- UIQ deeply seated faint enhancing lesion measures 21x20x19mm located 13cm from the nipple.
- **Complementary ultrasound:**
  1. UOQ 3 o'clock two **non enhancing** well circumscribed isoechoic mass lesions, they measure 9x5mm located at about 7cm from the nipple and 10mm from the skin and the second one measures 6x5mm located 4cm from the nipple and 6mm from the skin . **corresponding to the mammographic finding**
  2. 10-11 o'clock irregular hypoechoic mass with spiculated margins , **corresponding to mammographic and contrast finding**
  3. Solitary **indeterminate** level I axillary lymphnode show diffuse cortical thickness up to 2.5mm , however it is kidney shaped with preserved hilum

IMPRESSION:

RIGHT BREAST: Locally advanced malignant process with finding as described (BIRADS6 = pathologically proved malignancy I)

LEFT BREAST:

1-UIQ unifocal malignant enhancing lesion ((BIRADS6 = pathologically proved malignancy)

2-UOQ two non enhancing probably benign lesion (BIRADS3= probably benign)

3- UOQ grouped punctate calcifications(BIRADS3= probably benign)

Best regards,

Dr. Marwa Ramzy, FRCR

Exam : MAMMOGRAPHY BOTH	Age : 60 Year(s)
Medical ID: 4389/2023	Pat. ID: 48698

BILATERAL BREAST MAMMOGRAPHY AND HIGH RESOLUTION ULTRASOUND

Indication:

Bilateral breast cancer

Technique

- Bilateral MLO and CC views
- Bilateral 3D MLO views DBT (Digital Breast Tomosynthesis).
- Bilateral breast ultrasound

Report:

- The breasts are Scattered fibro glandular density (ACR B)
- Right breast diffuse malignant looking microcalcifications involving most of the breast parenchyma, reaching to the nipple, with no underlying findings see by US
- Left UIQ spiculated mass of high density with radioopaque clip seen within measuring 2.2x2.5 cm, seen 8.2 cm from the nipple. US showed 10:00 spiculated hypoechoic solid mass measuring 1.6x1.2 cm seen 0.29 cm from the overlying skin and indenting the underlying muscle
- Normal skin thickness and nipple-areola complex.
- Bilateral multiple non-specific axillary LNs, more prominent in the left axilla

Opinion:

- Right multicenteric pathologically proved malignant microcalcifications with complete response of ipsilateral axillary lymph nodes (BIRADS 6)
- Left UIQ partial response of pathologically proved malignant mass (BIRADS 6)

Yours truly

Report: - all studies

FULL FIELD DIGITAL MAMMOGRAPHY AND COMPLEMENTARY ULTRASOUND

INDICATION:

- Right breast pathologically proven IDC.

TECHNIQUE:

- CC and MLO view.
- Complementary ultrasound

REPORT:

- Scattered fibroglandular densities (ACR B).
- Right breast global asymmetry with overlying global microcalcifications extending to the nipple.
- Left breast inner rather central deeply seated focal asymmetry. Left UOQ circumscribed intermediate dense lesion also noted.
- This was confirmed by **Complementary Ultrasound** which showed
- Right breast diffuse pathological process in form of altered hypoechoic vascular parenchyma reaching to the nipple with subsequent nipple retraction, dilated subdermal lymphatics and overlying skin thickening.
- Left breast 10/ 11 O'clock irregular spiculated hypoechoic lesion surrounding by desmoplastic reaction and measuring 16 x 13 mm. it is away from the skin by 3.3 mm.
- Left breast UOQ two well defined hypoechoic oval lesions seen at 1 O'clock measuring 9 x 5 mm and at 2 O'clock measuring 7 x 5 mm.
- Normal left skin thickness and contour.
- Normal left nipple areola complexes.
- Right multiple enlarged axillary lymph nodes (level I,II) showing irregular cortical thickening and muffled hilum.
- Prominent right single supraclavicular lymph node.
- Left few axillary lymph nodes showing cortical thickening reaching 0.4 mm.

OPINION:

- Right breast pathologically proven diffuse malignant process as described along with ipsilateral infiltrated lymph nodes (level I.II) (BIRADS6).
- Left breast 10/11 O'clock highly suspicious lesion for histopathological

Tc-99m MDP WHOLE-BODY BONE SCINTIGRAPHY REPORT

Clinical Indication: Follow-up skeletal metastatic survey in a 62-year-old female with right breast carcinoma, presenting with active bone pain.

Procedure: Whole-body anterior and posterior planar bone scintigrams were acquired approximately 2 to 3 hours after I.V Tc-99m MDP administration.

Findings:

- Focal pathologically increased uptake is seen at the right frontoparietal bone. Multiple intense patchy focal areas of increased uptake involve numerous dorsolumbar vertebrae, with focal hyperactive retention in the sternum and a few bilateral ribs. Asymmetrical focal hyperfixation is scattered throughout the pelvic bones.
- Focal uptake is seen at the left shoulder girdle, with diffuse heterogeneous uptake and suspected early marrow infiltration along both humeral and femoral shafts.
- Symmetrical renal visualization with physiological bladder accumulation.

Impression:

- Widespread multifocal osteoblastic skeletal metastatic disease involving the right frontoparietal bone, numerous dorsolumbar vertebrae, sternum, bilateral ribs, pelvic bones, the left shoulder girdle, and suspected marrow infiltration along both humeral and femoral shafts.
- Radiological correlation and follow up as recommended as clinically indicated.

Much oblige
Dr. Alaa Nagi, MD
