تقرير طبي

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من	**بشأن تقرير طبي للمريض**
بقسم:	**رقم طبي:**

نتشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول : -- --:-- yyyy-mm-dd	**تاريخ وساعة الخروج :** PM 01:17 05-07-2026

وبعد الكشف والفحوصات والمتابعة وجد انة

المريضة تعاني من ورم غير حميد بالثدى و تحتاج الي **Contrast-enhanced CT of chest, abdomen, and pelvis**

التاريخ : **05-07-2026**	**الوقت :** **-- --:--**
	الطبيب المعالج : د/شيماء لاشين

National ID – Front & Back
[[DOCTYPE:ID_FRONT_BACK]]

Patient's Name:	**Zainab Anwar Gabr**
Date:	**2026-06-10**
Referred by:	Prof.Dr. no doctor
Hospital:	**Goustave Roussey International Egypt**

MULTISCLICE POST CONTRAST C.T. EXAMINATION OF THE CHEST, ABDOMEN AND PELVIS REVEALED:

Known case of breast CA with no available previous DICOM images for comparison.

I- CHEST:

- No pulmonary nodules, masses or cavitary lesions.
- No consolidation or collapse.
- No hilar or mediastinal masses or lymph node enlargement.
- No pleural or pericardial collection.
- Normal plain CT appearance of the heart and great vessels.

II- ABDOMEN AND PELVIS:

- Enlarged liver showing homogenous parenchymal attenuation. No hepatic focal lesion or dilated biliary radicles.
- Both kidneys are normal site, average sized and showing smooth regular cortical outline and preserved parenchymal thickness and function. No stones or back pressure changes.
- Normal C.T appearance of the spleen, pancreas, suprarenal glands, aorta and IVC.
- The urinary bladder shows no evidence of gross masses or diverticulae or stones.
- Normal appearance of the pelvic organs with no pelvic masses or collections.
- No abdominal or pelvic lymphadenopathy.
- No ascites.
- Multiple axial and appendicular skeleton predominantly lytic bone lesions.

Opinion:

- **Multiple axial and appendicular skeleton predominantly lytic bone lesions likely metastatic.**

Detailed Medical Report

السيد	

تحية طيبة وبعد,,

إيماء للطلب المقدم من		**بشأن تقرير طبي للمريض**	
بقسم:		**رقم طبي:**	

ننشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول :		**تاريخ وساعة الخروج :**	

وبعد الكشف والفحوصات والمتابعة وجد انه

The patient has metastatic breast cancer to bone and has received a regimen consisting of TAXOL, HERCEPTIN, XELODA, and TYKERB. The patient experienced severe hand-foot syndrome attributed to XELODA, and treatment with TYKERB was discontinued after 18 cycles. Current supportive therapy includes FEMARA, ZOMETA, and ZOLADEX.

The patient continues to have metastatic breast cancer to bone and has been treated with TAXOL, HERCEPTIN, XELODA, and TYKERB. Severe hand-foot syndrome from XELODA led to discontinuation of TYKERB after 18 cycles. The patient remains on FEMARA, ZOMETA, and ZOLADEX while awaiting pending laboratory results.

According to the multidisciplinary team (MDT) discussion in October 2024, the patient was diagnosed in May 2022 with de novo metastatic breast cancer to bone, confirmed by calcified biopsy as metastatic adenocarcinoma. The patient received palliative radiation therapy followed by 16 weeks of TAXOL plus HERCEPTIN IV and monthly ZOMETA. A bone scan demonstrated progressive disease, prompting initiation of TYKERB plus XELODA in November 2022; however, severe hand-foot syndrome from XELODA resulted in a treatment-related adverse event (CTCAE). By June 2023, the disease was stable on ZOMETA, FEMARA, and ZOLADEX, and a bone scan in September 2024 remained stable. The patient completed all approved cycles of TYKERB (no further approval from the Ministry of Health). The MDT recommended continuation of FEMARA, ZOLADEX, and ZOMETA while awaiting pending bone scan and CT CAP results. The most recent clinic visit was on 12 July 2026.

The most recent assessment shows a bone scan performed on 18 June 2026 indicating stable disease, and a CT CAP on 10 June 2026 also stable. The patient is currently free to continue FEMARA, ZOLADEX, and ZOMETA, with additional supportive treatment including a proton pump inhibitor, calcium, bone-specific therapy, and methylprednisolone. Laboratory results are acceptable, and the pharmacy has been notified to dispense the prescribed medications. The current plan is to maintain FEMARA, ZOLADEX, and ZOMETA with the supportive regimen.

Tc-99m MDP WHOLE-BODY SKELETAL SCINTIGRAPHY

- **Clinical History:** A 31-year-old female patient with a known history of right breast cancer. She is currently undergoing hormonal therapy and complains of bone aches. The scan is performed for follow-up and evaluation of therapeutic response, compared with the previous study dated 24-12-2025.
- **Technique:** Anterior and posterior whole-body planar scans were acquired 2 hours following the intravenous injection of Tc-99m MDP.

Findings

In comparison with the previous bone scintigraphy dated 24-12-2025:

- **Skeletal Metastases:** The previously described widespread active osseous lesions involving the sternum, bilateral ribs, multi-level spine, pelvic bones, scapulae, and proximal humeri demonstrate a **distinct reduction in both radiotracer intensity and spatial extent**, indicating a **regressive course.**
- No new focus points of pathologically increased radiotracer accumulation are detected throughout the rest of the skeleton.
- Stable degenerative features are noted in the spine and large joints.
- Normal physiological radiotracer distribution is seen in the kidneys and urinary bladder.

Impression

- **Regressive skeletal course** of the known widespread metastatic osseous lesions, indicating a favorable response to current therapy.
- No scintigraphic evidence of new skeletal metastases or active disease progression.
- Clinical and biochemical correlation is recommended as well as follow-up bone scan to monitor response.

Much oblige

Follow-up Whole Body (18F-FDG) PET/CT Study

History and Clinical Data:

Patient data:

- Weight: 78 Kg, Blood Glucose level: 75 mg/dl.

Clinical background:

- 29-year-old patient with history of managed metastatic right breast cancer.

Radiopharmaceutical:

- 159.1 MBq of 18F-FDG was injected I.V.

Purpose of the study:

- Follow-up considering the prior (FDG) PET/CT study report dated 31/12/2024.

Technique:

- Imaging was performed on an integrated PET/CT scanner approximately 60 minutes after injection of the radiopharmaceutical.
- Non-Contrast Enhanced CT images done for attenuation correction and anatomic localization were obtained followed by PET images from the vertex of the skull to the thighs.
- PET/CT images were reviewed in the transaxial, coronal and sagittal planes.
- The Standardized Uptake Value, maximum variant (SUV max) was calculated within regions of interest whenever needed.
- Reference **Hepatic SUV max ~ 3.9 and SUV mean ~ 2.2.**

Findings:

I) Locoregional (Both breasts and axillae):

- Tracer-starved right breast outer portion ill-defined soft tissue density, with no apparent FDG-avid parenchymal focal lesions detected.
- The left breast is unremarkable.
- No currently significant FDG-avid or pathologically enlarged axillary or other mammary-related lymph nodes.

II) Distant:

- **Rather stationary course of the priorly seen multiple low grade FDG-avid lytic osseous lesions scattered over the axial and appendicular**

PET Scan
[[DOCTYPE:PET_SCAN]]

Name : Zainab Anwar Gabr Awad
Branch : Maadi
Ref.Physician Prof : No doctor

Date : 07-07-2025 02:09
Medical No. : 143968

skeleton, eliciting SUV max up to ~ 2.8 at the left iliac bone. Low grade FDG-avid sclerotic osseous lesion is seen at the left calcaneus, eliciting SUV max ~ 2.9 (was up to ~ 3).

- No other distant FDG-avid focal lesions or pathological lymph nodes could be seen allover the surveyed body.

III) Rest of the body:

- No apparent brain focal lesions or pathologic tracer distribution.
- Few variable-sized low grade FDG-avid bilateral sub-mandibular and bilateral upper deep cervical lymph nodes, reaching ~ 1.2 cm and eliciting SUV max up to 3.7 cm at the left upper deep cervical group.
- Few tracer-starved bilateral lung scattered tiny nodules; likely non-specific, yet no FDG-avid pulmonary nodules, masses or infiltrates.
- No pleural or pericardial effusion, thickening or masses.
- Mildly enlarged liver with no FDG-avid focal lesions. No intra or extra-hepatic biliary radicle dilatation.
- Normal appearance of the spleen, pancreas, kidneys, suprarenals and pelvic structures.
- No pelvi-abdominal ascites or fluid collections.

IV) Side findings:

- IUD is seen in place.
- Spondylodegenerative changes are noted over the spine.
- Multiple atherosclerotic calcifications are noted within the large vessels.

NILE DIAGNOSTIC CENTER

PET Scan
[[DOCTYPE:PET_SCAN]]

Name : Zainab Anwar Gabr Awad
Branch : Maadi
Ref.Physician Prof : No doctor
Date : 07-07-2025 02:09
Medical No. : 143968

V) Normal physiological tracer bio-distribution is seen over the brain, glandular structures, heart, bowel and urinary tract.

Conclusion:

Follow-up whole body (FDG) PET/CT study for a managed metastatic right breast cancer patient shows:

- Non-metabolically active right breast outer portion ill-defined soft tissue density; likely remittent neoplastic.
- Stationary course of the multiple low grade metabolically active axial and appendicular residual metastatic osseous deposits.
- No newly developed metabolically active elsewhere allover the surveyed body.
- Follow-up whole body (FDG) PET/CT will be advisable as clinically warranted.

As Regards,

Dr. Moumen Katamesh, M.Sc
Nuclear Medicine

Dr. Yasser Mohamed
Professor of Nuclear Medicine

NILE DIAGNOSTIC CENTER

مستشفى أورام دار السلام
ادارة الاشعة

Patient Name: Zainab Anwar Gabr Awad	Date : 31/07/2024
Exam : C.T CHEST	Age : 28 Year(s)
Medical ID: 2047/2022	Pat. ID: 12442

NON-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST & PARA NASAL SINUSES:

1. **PNS:**
   - Polypoid mucosal thickening of right maxillary antrum/retention cyst.
   - Clear rest of the scanned paranasal sinuses. No air-fluid levels.
   - Clear right concha bullosa.
   - No CT evidence of hyper-densities within the mucosal thickening or bone destruction/erosions.
   - Patent osteomeatal units and sphenoethmoidal recesses.
   - Intact bony boundaries.
   - Bowing of the nasal septum to the right.
   - Prominent inferior nasal turbinates.
   - Bulky adenoid soft tissue.

   N.B: Destructive lytic lesion of the clivus is noted

OPINION:

- **Right maxillary sinusitis/retention cyst. No CT evidence of fungal sinusitis.**

2. **Chest:**
   - **Compared to previous study dated 31-12-2023.**
   - Still noted middle lobe micro nodules and atelectatic band.
   - No pulmonary areas of ground glass attenuation, consolidation or cavitary lesions.
   - No CT evidence of pathological mediastinal lymph node enlargement.
   - No pleural or pericardial collection, pleural thickening or masses.
   - No cardiac gross abnormalities.
   - Still noted axial and appendicular skeleton lytic lesions.

OPINION:

- **Rather stationary course since last study.**
