Patient Name: Fawzeya Abdel Hafez Mohamed	Date : 20/02/2023
Exam : C.T CHEST WITH CONTRAST	Age : 8 Day(s)
Medical ID:	Pat. ID: 28951

POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN & PELVIS REVEALED: -

1. Chest:

- Left small enhanced LOQ breast focal lesion is noted, measuring about 12.5x13cm.
- Clear both lung fields. No sizable pulmonary masses, areas of consolidation or cavitary lesions.
- No hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

2. Abdomen and pelvis:

- The liver is of average size with homogenous CT texture. No focal lesions or contour irregularities.
- Patent homogenously enhancing portal vein and is main branches as well as its main tributaries.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, aorta, I.V.C and right suprarenal.
- Bulky left suprarenal gland is seen.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.
- Spondylodegenerative changes of the vertebrae.
- No lytic or sclerotic bone lesions.

Mammographic Guided Stereotactic Wire localization:

Clinical summary: LT breast CA , For localization of left breast non palpable mass & 2 areas of coarse heterogeneous microcalcifications located at 12-1:00

Technique:

Under complete sterile conditions, 3ml of local anesthetic were administered at the site of concern in the LT breast. A 21G wire was used to localize the

Area 1: located at 1:00, 1.4cm deep to the skin, and 9cm from the nipple.

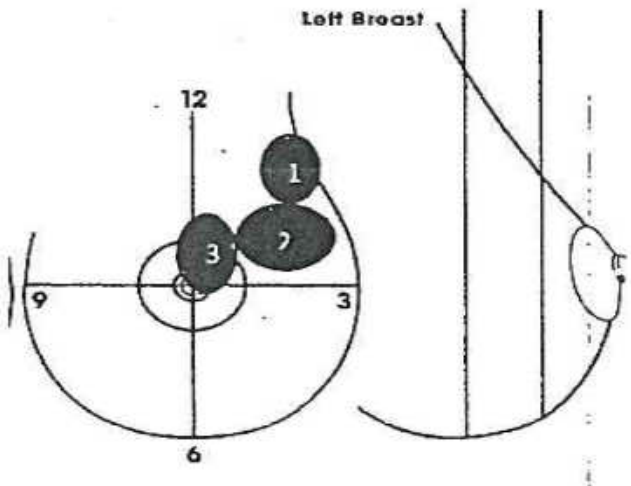

- The wire was inserted about 2cm from the skin mark over the area , the hook is in the centre of area of microcalcifications measures 2.3x1.9cm

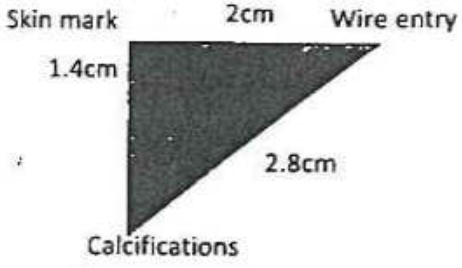

The mass : located at 1:00,1.7cm deep to the skin, and 6cm from the nipple.

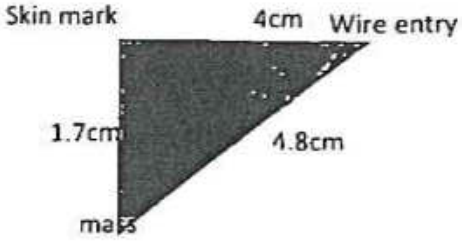

- The wire was inserted about 4cm from the skin mark over the clip, the hook is in the centre of the lesion

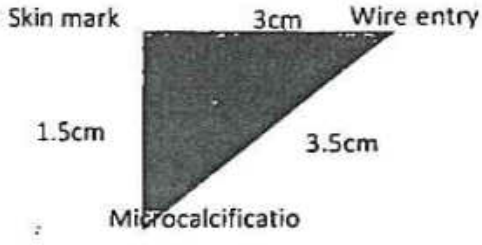

Area : located at 12:00, 1.5cm deep to the skin, and 4.5cm from the nipple.

-The wire was inserted 3cm from the skin mark, and the hook is in the centre of an area of microcalcifications measures2.1x1.3cm

Best Regards,
Dr Marwa Ramzy

High Resolution Ultrasonography

Clinical Presentation:

- Recalled from screening on 6/23/2019 for Two left UOQ clusters of amorphous calcifications
  - **Ultrasound Findings:**
  - Left area of altered hyperechogenecity with posterior acoustic shadowing at 1 o'clcok (corresponding to one of clusters of calcifications)
  - Left hetreogenous dense breast .
  - Left reactional intramammary LN at axillary tail.
  - Two cysts (0.5cm)seen at 12 o'clock with echogenic content in it, yet, no soft tissue component
  - Normal skin/nipple.
  - No pathological ax LN.

Conclusion:

- **Right Fibrocystic Breast with Two clusters of Mlaignant microcalcification for stereotactic guided wiring localization/ biopsy for Two clusters. B.I.R.A .D.S IV b**

Best regards,

DR: Nisreen Hassan

NON-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN & PELVIS REVEALED: -

A known case of breast cancer with left BCS.

As compared to the previous study dated 23/08/2023, the current study shows:

1. Chest:

- Status post left BCS with evidence of reconstruction shows stationary course of the increased parenchymal thickness with decrease in size of the prominent left axillary level I lymph nodes.
- Clear both lung fields. No sizable pulmonary masses, areas of consolidation or cavitary lesions.
- No sizable hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size. No pericardial effusion detected.
- Normal non enhanced CT appearance of the thoracic aorta and the great vessels.
- Upper abdominal cuts are remarkable
- Scanned skeleton shows: no sizable lytic or sclerotic bone lesions.

OPINION:

Status post left BCS shows:

- **No evidence of pulmonary metastatic disease or inflammatory process**

Exam : ultrasound BREAST (BOTH SIDE)	Age : 62 Year(s)
Medical ID: 606/2023	Pat. ID: 30913

BILATERAL BREAST HIGH RESOLUTION ULTRASOUND

Indication:

Patient had left CBS in

Technique

- Bilateral breast ultrasound

Report:

- eft breast UOQ 3 o'clock well defined heterogenous echogenic lesion measured 13x7mm likely fat necrosis
- left breast 4-5 o'clock focal parenchyma distortion, owing to prior surgical interference with clear operative bed with no evidence of recurrent mass lesions.
- no right breast solid or cystic mass lesions, normal skin thickness and nipple-areola complex.
- Nonspecific nght axillary LN, with preserved fatty hila and unitorm cortical thickness.
- Free left infra and supra clavicular regions.

Opinion:

- Left breast 3 o'clock well defined heterogenous echogenic lesion likely fat necrosis BIRADS 3)
- Left breast lower focal parenchymal distortion owing to prior surgical interference (CBS) with post-operative sequel, with free operative bed with no evidence of recurrent mass lesions
- Normal study of the right breast (BIRADS 1)

Exam : ultrasound BREAST (BOTH SIDE)	Age : 62 Year(s)
Medical ID: 606/2023	Pat. ID: 30913

BILATERAL BREAST MAMMOGRAPHY AND HIGH RESOLUTION ULTRASOUND

Indication:

Right BCS

Technique

- Bilateral MLO and CC views
- Bilateral 3D MLO views DBT (Digital Breast Tomosynthesis).
- Bilateral breast ultrasound

Report:

- The breasts are heterogeneously dense which may obscure small lesions (ACR C)
- Right diffuse skin thickening with underlying trabecular thickening with LIQ parenchymal distortion with increase in size and extent of the overlying micro-calcific foci probably of dystrophic nature. US showed 4:00 and Retroareolar area of parenchymal disruption owing to operative bed with no underlying solid or cystic lesions seen
- No suspicious mass lesions, suspicious micro calcifications or architectural distortion detected.
- Complementary ultrasound showed no solid or cystic mass lesions.
- Normal left skin thickness and nipple-areola complex.
- Left Nonspecific axillary LNs.
- Right no pathological lymph nodes

Opinion:

- Right postoperative changes with no underlying suspicious lesion or recurrence (BIRADS 2)
- Normal left breast study (BIRADS 1)

BILATERAL BREAST MAMMOGRAPHY AND HIGH RESOLUTION ULTRASOUND

Indication:

Left breast conserving therapy

Technique

- Bilateral MLO and CC views
- Bilateral breast ultrasound

Report:

- Scattered fibro glandular density (ACR B)

Left breast:

- Left breast para-areolar 12 o'clock heterogeneously echogenic lesion measuring 22 X 12 mm.
- Operative bed parenchymal distortion and scarring with no sizable mass
- No suspicious mass lesions, micro calcifications
- No sizable collection
- Diffuse edema pattern in the form of increased trabeculations and skin thickness.
- No regional lymphadenopathy

Right Breast:

- No suspicious micro calcifications or architectural distortion detected.
- No spiculated mass
- Normal retro-areola ducts
- Normal skin thickness, and nipple-areola complex
- Nonspecific axillary LN.

Opinion:

- Post left BCS status showing operative bed para-areolar12 o'clock lesion (BIRADS 3) for close follow up.
- Normal study of the right breast (BIRADS 1)

^{99m}Tc-MDP BONE SCAN

Brief history: 59 years old female patient diagnosed with managed left breast cancer.

Desired Information: - skeletal survey.

Technique:

Delayed Whole body imaging in anterior and posterior projection performed 2 hours after I.V administration of 20 mCi ^{99m}Tc-MDP in the following manner.

Report:

- *No hot spot that account for osseous deposits could be detected allover the surveyed skeleton.*
- *Spondylo-degenerative changes are seen over dorso-lumbar vertebrae.*
- *Pronounced osteoarthrosis noted over both knees joints.*
- *Both kidneys are normally visualized.*

Conclusion:

Negative study for the detection of any definite metastatic osseous deposits.

Thanks for reference

$Tc^{99}m$ MDP SKELETAL SCINTIGRAPHY

Clinical history

- Female patient with history of left breast neoplasm.

Technique

- Anterior and posterior whole body scans were acquired 2 hours post IV injection of 740 MBq of the tracer.

Findings

- Focal tracer uptake is seen in the left frontal bone.
- Degenerative changes of the spine are noted, more pronounced in lumbar vertebrae.
- Osteoarthritic changes of both knees and shoulders are noted.
- The rest of the survey skeleton is unremarkable.

Opinion

- **Single worrying osseous lesion in the left frontal bone, likely metastatic for radiological correlation.** → traumatic

Pathology Report

Clinical Data: Left breast mass
Nature of the specimen:
Left wide local excision and sentenil lymph node biopsy specimens , collected at 13/6/23

Gross Examination:
Two specimens were recieved :
-Sentenil lymph node biopsy : Fibrofatty tissue peice measured 3x2 cm , enclosing 4 nodules up to 0.7 cm
-Left wide local excision specimen measured 10.5x8x3 cm with no covering skin elipse .Cut section revealed two wired firm greyish white masses. The first measured 2x1.5x1 cm , 0.5 cm away from least superficial margin.The second measured 1x1x0.5 , 1 cm away from least deep margin.
• Frozen section:
-Free SLNs(0/4)
-Free margins

Microscopic examination:
*First wired area:
Ductal carcinoma insitu (high grade)
*Second wired area
- Invasive duct carcinoma, Grade II with Predominant ductal carcinoma insitu (high grade).
• Angioinvasion: Not detected
• Lymph node involvement:Free (0/4)
• Resection Margins: Free all reescted margins
• Perineural invasion : Positive

Diagnosis:
Left breast mass , wide local excision and sentenil lymph node Biopsy specimens:

IMMUNOHISTOCHEMISTRY REPORT

Clinical Data: Left breast lesion

Nature of the specimen: Tru-cut biopsy, collected at 29/1/2022, 3:50 PM.

Gross Examination:
Seven grayish white and fatty tissue cores, 0.5 cm long each, totally submitted.
Sections prepared from paraffin block for immune- staining using Bench Mark ULTRA system for ER, PR HER2, ER clone (1D2), PR clone (SP1), HER-2 clone (4B5), & Ki67 clone (30-9)

Microscopic examination:
- Histological type: Invasive duct carcinoma
- Grade (differentiation+ nuclear pleomorphism + mitosis): II (3+2+1)
- Angioinvasion: Negative
- Ductal carcinoma in situ: Focal (comedo and cribriform)
- Additional pathologic findings: No microcalcification.
- IPT

ER: No nuclear reaction in tumor cells (Allred score 0/8)
PR: No nuclear reaction in tumor cells (Allred score 0/8)
Her-2: strong complete membrane reaction in >10% of tumor cells (score 3+)
Ki 67: 30 % nuclear reaction in tumor cells

Diagnosis:
Left breast lesion; Tru-cut biopsy:
- Invasive duct carcinoma, grade II
  ER: Negative (0/8)
  PR: Negative (0/8)
  HER2: Positive (score3+)
