CT

CT SCAN OF THE ABDOMEN AND PELVIS WITHOUT CONTRAST:

TECHNIQUE: Multislice axial CT images of the abdomen and pelvis were obtained followed by multiplanar reconstruction of the source images. No contrast was used.

CLINICAL HISTORY: A -57-year-old diabetic and hepatic with history of thyroidectomy. Now she complains of chronic constipation

FINDINGS:

- The liver is cirrhotic with irregular borders, however showing homogenous CT density and no focal lesions on a non-contrast basis study.
- No intra or extra hepatic biliary radicles dilatation.
- Normal CT appearance of the spleen, pancreas, both kidneys, suprarenal glands, and IVC.
- Inadequately distended urinary bladder showing no stones, masses or diverticulae.
- **Bilateral mixed and solid adnexal lesions. The right lesion measures 4.2x3.8 cm and the left lesion measures 4.6x4.2 cm.**
- **Moderate to marked pelvi-abdominal ascites.**
- Few aorto-pulmonary window, subcarinal, mediastinal and abdominopelvic enlarged lymph nodes.
- Few pelvic phleboli
- Bilateral dorsal elastofibroma (incidental finding)

Detailed Medical Report

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من		**بشأن تقرير طبي للمريض**	
بقسم:		**رقم طبي:**	

ننشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول :		**تاريخ وساعة الخروج :**	

وبعد الكشف والفحوصات والمتابعة وجد انه

The patient is a 70-year-old individual with a history of thyroid cancer treated with thyroidectomy and radioactive iodine in 2006. Presenting with progressive abdominal pain and constipation, an MRI performed on 16/08/2026 revealed extensive bilateral complex solid-cystic adnexal masses with uterine involvement, highly suspicious for bilateral ovarian adnexal carcinoma. The masses are aligned with local pelvic extension and there is no definite preserved plane of cleavage from the anterior rectosigmoid junction, raising concern for bowel involvement. Multiple bilateral restricting hepatic lesions suspicious for hepatic metastases are noted, along with inter-regional peritoneal and retroperitoneal soft tissue changes, massive ascites, mild distal descending colon mural thickening, and indeterminate metastatic serosal involvement. Upper gastrointestinal evaluation was negative for malignancy. Colonoscopy was performed and was free of lesions. A CA-125 level of 99 was obtained for ascitic tap and cytology analysis. Biopsy of liver or adnexal mass was recommended.

On 10/09/2026, the imaging findings were reiterated, and cytology from ascites was reported positive for malignancy with immunohistochemistry compatible with a Müllerian origin. The plan was to initiate weekly Taxol and carboplatin on a private basis until further evaluation (MOHR).

A clinical pharmacy note on 10/09/2026 documented the patient's weight (95 kg), height (155 cm), and serum albumin (2 g/dL). The first week of therapy (w1) was prescribed Taxol 150 mg and carboplatin with an AUC of 2. The patient has completed 1 week of the Taxol/Carboplatin regimen to date.

CT

- Scanned lung bases show moderate left pleural effusion, veiling and thick atelectatic bands.
- Atherosclerotic changes and calcifications of the aorta.

OPINION:

- **Cirrhotic hepatic changes**
- **Bilateral mixed solid and cystic adnexal lesions. For dedicated contrast study enhanced MRI examination and CA 125 correlation.**
- **Moderate to marked pelvi-abdominal ascites.**
- **Mild left pleural effusion.**

INDICATION FOR EXAMINATION

Screening for CRC

Diagnosis

PROCEDURE PERFORMED

Diagnostic

MEDICATIONS

Propofol

Preparations and Procedure Details

Colonoscopy is done up to hepatic flexure

FINDINGS:

Colon

The whole exposed mucosa looks normal. Very tough adhesions are causing colon fixation with difficult manipulation. Introduction to cecum was not possible.

Congested internal piles are seen.

Ileum

-

Conclusion

Normal examined par of colon.
Congested internal piles.

INDICATION FOR EXAMINATION

PROCEDURE PERFORMED
Diagnostic

MEDICATIONS
Propofol

Esophagus
Incompetent cardia. The lower end is hyperemic.

Stomach
The whole mucosa is hyperemic, more pronounced at antral region.
Antral biopsies are taken for HPE.

Pylorus
Rounded and active

Duodenum
The mucosa is hyperemic down to the third part

Conclusions
Mild reflux oesophagitis.
Pangastritis.
Duodenitis.

Clinical Diagnosis : Ascitis.

Nature of Specimen : Block (Ascitic fluid, Cytology, labelled as 1089356).

Receiving Date : 2026-08-27 **Patient ID :** 794520

IMMUNOHISTOCHEMISTRY REPORT

Technique :

Sections were prepared from the paraffin block, processed in Benchmark Ultra machine (Ventana) and stained by rabbit monoclonal antibodies using Ultra view HRP DAB as chromogen and hematoxylin as counter-stain .
The sections were treated against:
- Ck 7 \ PAX8 \ WT1 \ P53 \ ER (Estrogen receptor).

Results :

Tumor cells are POSITIVE for Ck 7.
Tumor cells are POSITIVE for PAX8.
Tumor cells are NEGATIVE for WT1.
P53 showed weak expression (mutation could not be assessed).
Sections treated for Estrogen receptors revealed NEGATIVE nuclear staining.

Conclusion :

Block, MALIGNANT ASCITES ARE COMPATIBLE WITH MULLARIAN ORIGIN.
-TUMOUR CELLS ARE NEGATIVE FOR ESTROGEN RECEPTORS (SCORE 0 / 8).
N.B: P53 WEAK EXPRESSION PREVENT PROPER ASSESSMENT OF P53 MUTATION, TISSUE BIOPSY IS MANDATORY FOR PROPER SUBCLASSIFICATION OF THE TYPE OF CARCINOMA.

PATHOLOGY REPORT

Gross :

Two bags were received:
1- 2000 cc of semiturbid yellow fluid.
2- 1800 cc of semiturbid yellow fluid.

Microscopic :

Cytological examination of the films and cell blocks prepared from the centrifugate of the fluid received revealed red blood cells, inflammatory cells, scattered groups of epithelial cells with moderate nuclear pleomorphism arranged in tridimentional and acinar patterns in proteinaceous background.

Diagnosis :

Ascitic fluid, Aspirate, Cytology, POSITIVE FOR MALIGNANT CELLS.
CASE FOR IMMUNOPHENOTYPING.

Patient's Name:	**Awtif Abdulrahman Afifi Al-Ardi**
Date:	**2026-08-26**
Referred by:	Prof.Dr. **gustave doctor**
Hospital:	**Goustave Roussey International Egypt**

MULTISCLICE C.T. EXAMINATION OF THE ABDOMEN AND PELVIS FOLLOWING ORAL CONTRAST ADMINISTRATION REVEALED :

- Average sized liver showing heterogenous parenchymal attenuation. Few bilobar hypodense focal lesions largest measuring 15 x 9 mm at segment IV. No dilated IHBRs.
- Multiple omental cakes are seen largest measuring 18 x 14 mm.
- Both kidneys are normal site, average sized and showing smooth regular cortical outline and preserved parenchymal thickness. No stones or back pressure changes.
- Small bowel loops show multiple air/fluid levels with no significant distension.
- Bilateral bulky adrenal glands.
- Normal non-contrast C.T appearance of the spleen, pancreas.
- Mildly thickening of the pyloric wall reaching 25 mm in thickness.
- The urinary bladder shows no evidence of gross masses or diverticulae or stones.
- Two bilateral adnexal cysts measuring 50 mm on the right side and 26 mm on the left side. The right side cyst is hyperdense.
- Normal appearance of the rest of pelvic organs.
- Multiple subcentimetric bilateral internal and external iliac lymph nodes.
- Moderate ascites.
- Basal chest cuts showed mild left pleural effusion with underlying subsegmental lung collapse and few tiny right lower lobe pulmonary nodules.

Opinion:

- **Chronic parenchymatous liver disease with few bilobar hypodense hepatic focal lesions for dynamic MR study.**
- **Multiple omental cakes.**
- **Mildly thickened pyloric wall for endoscopy.**
- **Multiple small bowel loops air-fluid levels yet with no evident distension for clinical correlation.**
- **Bilateral bulky adrenal glands.**
