History

- A64-year-old lady withhistory ofbreast cancer.

Technique

- Anterior and posterior whole body scans were acquired 2 hours post injection of 20 mCi of the tracer.

Findings

- Warm tracer uptake is noted at lower dorsal and upper lumbar spine.
- Arthritic changes are noticed at large joints.
- Otherwise, the rest of the scanned skeleton is unremarkable.

IMPRESSION

- No convincingscintigraphic evidence of osseous metastases identified.
- Benign looking tracer uptake pattern confined to spine as described, likely degenerative, for regional radiological correlation and follow up.
