Detailed Medical Report

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من		**بشأن تقرير طبي للمريض**	
بقسم:		**رقم طبي:**	

ننشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول :		**تاريخ وساعة الخروج :**	

وبعد الكشف والفحوصات والمتابعة وجد انه

The patient is a 61-year-old individual with hypertension, cardiac disease, and diabetes mellitus. There is no reported family history of malignancy. The clinical history includes a left-sided invasive lobular carcinoma, pleomorphic, grade 2.

Biopsy of the left breast revealed invasive lobular carcinoma, pleomorphic, grade 2. Immunohistochemistry shows estrogen receptor 8/8, progesterone receptor 8/8, HER2 +2, and Ki-67 reported as SISH amplification. Imaging demonstrates a left-sided speculated mass in the upper outer quadrant measuring 39 × 38 mm at the 3 o'clock position with overlying skin dimpling and nipple retraction, classified as ACR B on sonomammography, and a left pathological lymph node measuring 39 × 26 mm. Staging workup with CT of the chest, abdomen, and pelvis and bone scan are negative for metastatic disease.

The referring team recommends clip insertion followed by neoadjuvant chemotherapy if breast-conserving surgery is planned, noting a clinical stage of T2 N2 M0 with average breast size and a mass causing dimpling without skin infiltration. The multidisciplinary team advises contrast-enhanced spectral mammography (CESM) for the left invasive lobular carcinoma and surgical mammography from April 2026, pre-neoadjuvant chemotherapy evaluation of the contralateral side, and further surgical decision-making, together with echocardiography and cardiac catheterization. The plan is to initiate TCHP chemotherapy for six cycles, then proceed with left mastectomy given the skin dimpling and nipple retraction.

WHOLE-BODY BONE SCINTIGRAPHY REPORT

Indication: Newly diagnosed left breast carcinoma. Staging workup.

PROCEDURE

Anterior and posterior whole-body images following IV ^{99m}Tc-MDP.

FINDINGS

- No definitive focal active or cold osseous lesions could be depicted that would account for metastatic pathology.
- Variable tracer uptake along spine and sternum consistent with degenerative changes.
- Mild-to-moderate uptake in both shoulders and knees bilaterally—consistent with degenerative joint disease.
- Normal renal excretion with bladder activity. No abnormal extraskeletal uptake.

IMPRESSION

- No scintigraphic evidence of skeletal metastases.
- Follow up as per clinical pathway.

Much oblige
Dr. Alaa Nagi, MD

Pathology Report

Clinical Data: Left breast UOQ mass.(BIRADs 5).
Nature of specimen: Tru-cut biopsy, collected on 23/4/2026, at 12:20 pm, cold ischemia time is 20 seconds.

Gross examination:
Two gray white tissue cores, each measured 1 cm long. Totally submitted.

Microscopic examination
* Histological type: Invasive pleomorphic lobular carcinoma.
* Grade 2 (differentiation 3, nuclear pleomorphism 2, mitosis 2).
* Ductal carcinoma in situ: Absent.
* Lobular carcinoma in situ: Absent.
* Angioinvasion: Absent.
* Perineural invasion: Absent.

Diagnosis
Left breast UOQ mass, Tru-cut biopsy:
Invasive pleomorphic lobular carcinoma, Grade 2.
- For further IHC (ER, PR, HER2, Ki67).

IMMUNOHISTOCHEMISTRY REPORT

Clinical Data: Left breast UOQ mass (BIRADs 5) diagnosed "Invasive pleomorphic lobular carcinoma, grade 2".
Nature of specimen: Tru-cut biopsy, collected on 23/4/2026, at 12:20 pm, cold ischemia time is 20 seconds.

Technique:
- Sections were prepared from the paraffin block, processed in Bench Mark ULTRA machine (Ventana) stained by rabbit monoclonal antibodies using Ultraview HRP DAB as chromogen and hematoxylin as counter-stain. The sections were treated against: ER clone (1E2), PR clone (SP1), Her2 clone (4B5), Ki67 clone (30-9) & SISH.

Results:
* IPT (All controls showed appropriate reactivity):
- ER: Strong nuclear reaction in 95% of tumor cells (Score 8/8).
- PR: Strong nuclear reaction in 95% of tumor cells (Score 8/8).
- Her2: Moderate complete membrane reaction in more than 10% of tumor cells (Score 2+).
- SISH: Amplified.
(Average Her2 copy No.: (4.3), Her2/CEP17 ratio: (2.09)).
- Ki67%: 10%.

Results:
Left breast mass, Tru-cut biopsy:
IPT:
- ER: Positive (score 8/8).
- PR: Positive (score 8/8).
- Her2: Equivocal (score 2+).
- SISH: Amplified, Group I.

POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST WITH CORONAL RECONSTRUCTION: -

Clinical History:

- **A new case of left breast cancer.**

Findings:

- Left breast UOQ mass is seen measuring 3.6x3.7cm.
- Left axillary enlarged LNs largest 3.5cm.
- Clear right breast and right axilla.
- Clear both lung fields. No sizable pulmonary nodules, masses, areas of consolidation or cavitary lesions.
- No hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

OPINION:

- Left breast UOQ mass.
- Left axillary enlarged LNs.
- Clear right breast and right axilla.
- No lung metastasis.

MULTI-SLICE CT SCAN OF THE ABDOMEN AND PELVIS AFTER I.V. CONTRAST ADMINISTRATION: -

Findings:

- The liver is of average size with homogenous CT texture. No focal lesions or contour irregularities.

CT Scan
[[DOCTYPE:CT_SCAN]]

Patient's Name:	**Azza Abdelhalim Eissa Abdel Aal**
Date:	**2026-06-09**
Referred by:	Prof.Dr. **no doctor**
Hospital:	**Goustave Roussey International Egypt**

- Patent homogenously enhancing portal vein and is main branches as well as its main tributaries.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, aorta, I.V.C and both suprarenals.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.

Opinion:

- **No hepatic or bony metastasis.**

Clinical Background

Diagnostic mammography for a 60 y/o female complaining of left breast mass. Negative family history.

Bilateral Digital soft tissue mammography.

- Scattered mixed densities of glandular condensations are seen involving the both breasts (ACR B).
- **A speculated border mass is seen in UOQ of left breast.**
- **A dense large left axillary LN.**
- Normal skin thickness & contour of both breasts.

High resolution breast sonography reveafd.

- Echogenic mammary parenchyma.
- **A solid hypoechoic mass with speculated borders measuring 39 X 38 mm is seen in let breast at 3 o'clock causing skin dimpling and nipple retraction.**
- No retroareolar ductal dilation.
- **Left pathological axillary LN measuring 39 X 26 mm.**
- Right likely non- specific axillary lymph nodes.

Opinion

- Left suspicious breast mass with left pathological axillary LN for biopsy (BIRADS 5).

-Right breast is free (BIRADS 1).

BIRADS calcification of breast lesions according to the American Collage of Radiology used for breast assessment combined with recommendations:

Category & recommendations	Suspected Cancer Risk
BIRADS 0: Non- informative study.	0 %
BIRADS 1: Normal, routing screening.	0 %
BIRADS 2 Benign findings, routing screening	2 %
BIRADS 3: Probably benign, for close follow up.	50 %
BIRADS 4: Probably malignant, for biopsy.	
A: mild suspicion.	
B: moderate suspicion.	
C: high suspicion	98-100%
BIRADS 5: Malignant, for biopsy.	
BIRADS 6: Pathologically proven malignant lesion.
