Clinical Data

Lt. breast cancer

Gross Picture :

["Referred block submitted for ER/PR immunostaining."]

System Used :

["Ventana BenchMark ULTRA autostainer."]

Antibody:

["Ventana anti-PR[1E2] Rabbit monoclonal antibody, Ventana anti-ER[SP1] Rabbit monoclonal antibody."]

Scoring system :

According to the ASCO/CAP guideline update, 2019 : Samples with 1% to 100% of tumor nuclei positive for ER or progesterone receptor (PgR) are interpreted as positive. If ER (not PgR), 1% to 10% of tumor cell nuclei are immunoreactive, the sample are reported as ER Low Positive. A sample is considered negative for ER or PgR if < 1% or 0% of tumor cell nuclei are immunoreactive. Allred score: proportion of cells staining (0, no staining; 1, <1%; 2, between 1% and 10%; 3, between 11% and 33%; 4, between 34% and 66% and 5, between 67%–100% of the cells staining). Intensity of positive tumor cells (0, none; 1, weak, 2, intermediate; and 3, strong). Total score from 0 to 8. Comment: - There are much more limited data on the 2% to 3% of cancers that are low ER expressers (most often defined as 1%-10% ER-positive cells by IHC) and their potential benefit from endocrine therapy. - PR positive in 1-20% of tumor cells is considered as Low positive.

(Laterality) breast Cancer:

["left"]

Diagnosis :

ER: Positive, strong nuclear reaction in 95% of tumor cells [8/8].
PR: Positive, strong nuclear reaction in 50% of tumor cells [7/8].
