تقرير طبي

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من	بشأن تقرير طبي للمريض
بقسم:	رقم طبي:

نتشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول : -- --:-- yyyy-mm-dd	تاريخ وساعة الخروج : PM 01:17 05-07-2026

وبعد الكشف والفحوصات والمتابعة وجد انة

المريضة تعاني من ورم غير حميد بالثدى و تحتاج الي Contrast-enhanced CT Chest & abdomen and pelvis

التاريخ : 05-07-2026	الوقت : -- --:--
	الطبيب المعالج : د/شيماء لاشين

PATHOLOGY DEPARTMENT
HISTOPATHOLOGICAL REPORT

Patient name: عزه شويمي محمد عبدالجيد	**Age: 43 years**	**Sex:** female
Request type: مبادره	**Sub request type:**	
Hospital no:	**Pathology no.:**1026-2026	
Department: صحه مرأه	**Date of result:**29/9/2026	
Referred by: د/ايمان علي	**Date of biopsy:**23/9/2026	
Nature of specimen: Tru-cut biopsy	**I.D. Number:28307032102941**	
Clinical diagnosis: Right breast mass		

Gross pathology :

Multiple fragmented grayish white tissue cores up to 1cm long, totally submitted.

Immunohistochemical Technique:

Sections were prepared from the paraffin block, processed in Benchmark Ultra machine (Ventana) and stained by rabbit monoclonal antibodies using Ultra view HRP DAB as chromogen and hematoxylin as counter-stain. The sections were treated against: -ER- PR- Her2- KI67

Microscopic picture:

Section examined revealed core of tumor showing malignant growth formed of nests, files, targetoid pattern, tubules and cribriform pattern infiltrating among desmoplastic stroma. Tumor cells showing marked anaplasia and poor tendency to from tubules. There is moderate number of mitotic figures.

Immunohistochemical Result

ER: Strong nuclear staining in 90 % of tumor cells (Allred Score 8/8).
PR: Strong nuclear staining in 90 % of tumor cells (Allred Score 8/8).
Her2: Weak incomplete membranous staining in >10% of tumor cells (score 1+) low.
Ki67: Positive nuclear staining of 70% of tumor cells.

Diagnosis: Right breast mass ,Tru-cut biopsy :

Invasive Mammary Carcinoma, Grade III.

Women's Health Outreach Program

Bilateral Full field Digital Mammography and high-resolution ultrasound.

Clinical summary: 44 years old female patient with right breast lump.

Right breast:

- Heterogeneously fibro glandular densities (ACR density C).
- The right breast shows middle/posterior 1/3 outer central region an ill-circumscribed spiculated dense mass lesion with internal microcalcifications within and architectural distortion.

Ultrasound revealed:

- Prominent glandular elements of breast parenchyma with mottled appearance.
- Right outer central 9 o'clock position an ill-defined irregular hypoechoic mass lesion with fine internal microcalcifications measuring about 2.4 x 2 x 1.5 cm about 4 mm deep to the skin and about 6.8 cm from the nipple.
- Related anteriorly prominent retroareolar ducts??Extension.
- Normal nipple/areolar complex.
- Enlarged right axillary lymph node with focal cortical thickness about 3.5 mm, measuring about 19.5 x 7mm.

Left breast:

- Heterogeneously fibro glandular densities (ACR density C).
- No masses, asymmetric densities, distortion or suspicious clusters of micro calcifications.
- Ultrasound demonstrated no solid or cystic lesions.
- Normal skin/subcutaneous tissue and nipple/areolar complex.
- Non-specific axillary LNs.

Impression:

- **Right breast (BIRADS 4C): right outer central highly suspicious mass lesion as described. for Tru cut biopsy and CESM study is highly recommended.**
- **Left breast (BIRADS 2): fibroadenosis.**

Much obliged,

Dr. Ayat Nadi, FEBR, ABR
