BSTM AND COMPLEMENTARY ULTRASOUND

Indication:

Post NACT status assessment of a known left breast malignant mass, as compared to last study report dated 6-2022

Report:

- ACR b: scattered fibro-glandular parenchyma of both breasts
- Left breast:
 - Size regression of the forenoted (11-1 o'clock) malignant mass lesion, currently measures 39 x 23 mm compared to 47 x 33 mm previously.
 - Regressive course of the previously reported left axillary lymphadenopathy , largest pathological one currently measures 14 mm compared to 19 mm previously. It shows ductal extension to the nipple.
- Right breast:
 - No suspicious micro calcifications or architectural distortion detected.
 - Complementary ultrasound no cystic or solid mass lesions.
 - Normal skin thickness, and nipple-areola complex with average caliber of the retro-areolar central ducts.
 - Nonspecific axillary LN.

Opinion:

- Post NACT status of left breast malignancy showing evidence of partial radiological response as described (BIRADS 6)
