Department : Out Patient
Registered by : Mrs.Mayada Hegazy

Pathology Report

Clinical Data: PET-CT showing circumferential right irregular nodular pleural thickening associated with metabolically active FDG avid right hilar nodal mass complex.
Nature of Specimen: Referred block & slide (Tru-cut biopsy).

Gross Examination:

- One referred paraffin block & one H&E stained slide were received labelled by (1031268).
- Sections prepared from paraffin block for immune-staining using Bench Mark ULTRA system for; WT-1 clone (6F-H2) & Calretinin.

Microscopic Examination:

- Histopathological examination reveals cores of pleura infiltrated by tumor formed of groups of epithelioid cells having ample eosinophilic cytoplasm and large pleomorphic nuclei embedded in desmoplastic stroma.
- * IPT (Positive control showing appropriate immunoreactivity):
- Calretinin: Diffuse strong positive staining in the tumor cells.
- WT-1: Focally positive in the tumor cells.

Diagnosis:

Right pleural thickening, Referred block & slide (Tru-cut biopsy):
The histomorphological & immunohistochemical findings are consistent with malignant mesothelioma (Epithelioid type).

Patient Name : مرفت شعبان عبد الفضيل محمد

Analysis ID : 1031268

Age : 55 Y : 8 M : 7 D

Gender : Female

Conf. Code : 1876

Referred By Prof. Dr. :

Clinical Diagnosis : Right pleural thickening

Nature of Specimen : CT guided biopsy

Receiving Date : 2026-02-03

Patient ID : 757886

PATHOLOGY REPORT

Gross :

Multiple cores measured 0.5 cm up to 1.5 cm long, totally submitted.

Microscopic :

Sections examined from the specimen received reveal cores of pleural tissue infiltrated by malignant epithelial cells, arranged in cords and adenoid pattern, with eosinophilic cytoplasm, surrounded by moderate desmoplasia.

Diagnosis :

Right pleural thickening, CT guided biopsy, EPITHELIAL TYPE NEOPLASM
INFILTRATING PLEURA.

- CASE FOR IMMUNOPHENOTYPING.

Nature of specimen: U/S Guided Pleural Biopsy

Data given :

Slide No : 10 Hospital No: --

Date of receiving : 1/1/2026 Ward : U/S

Histopathology / Cytopathology Report

Gross Features:

fragmented cores of greyish white tissue of 1cm totally, ESS1

Microscopic Feature:

Microscopic examination revealed fibrotic pleural tissue infiltrated by chronic inflammatory cells up to lymphocytic aggregates formation, rest of specimen showed areas of congestion.

Diagnosis:

U/S Guided Pleural Biopsy: picture is compatible with chronic pleurisy.
Please correlate with the clinical and radiologic findings.

Ref. By Prof. Dr.	Waleed Mohamed Al-Serogy	Date	26/1/2026
ID	9926001661	Acc. No.	240292939

The Musculo-skeletal System:

- Spine degenerative changes noted.
- Normal appearance of the bony skeleton with no evidence of any abnormal avid focal tracer uptake seen.

Abdomen and Pelvis:

- No FDG avid focal hepatic lesion could be seen.
- Normal size, parenchymal tracer uptake and CT texture of both kidneys; spleen; pancreas & both adrenals with no focal lesions or dense tracer fixing foci seen.
- No pathologically enlarged or dense tracer fixing LNs seen.
- No ascites, abdominal or pelvic collections noted.

Opinion:

- Positive study shows FDG avid circumferential right irregular nodular pleural thickening associated with metabolically active FDG avid right hilar nodal mass complex for pathological correlation.
- Follow up PET/CT as clinically warranted would be advisable.

THANK YOU FOR REFERRAL.

MULTI-SLICE PET/CT EXAMINATION OF THE BODY:

Clinical History:

- A 56-year-female patient diagnosed with **right pleural effusion**
- **PET/CT requested for status evaluation.**

Technique:

- For the aforementioned patient we have done a total body PET scan one hour after IV injection of 300 MBq of 18 F-FDG.
- MSCT performed and used for attenuation correction, anatomical localization and diagnosis.
- Max. Variant of SUV; a Semi-quantitative analysis would be done for selected ROI.s and the normal threshold is < 2.5.

Findings:

Chest:

- **FDG avid circumferential right irregular nodular pleural thickening SUVmax 6.5.**
- **Right mild pleural effusion.**
- **Metabolically active FDG avid right hilar nodal mass complex measures 2.5 cm SUV max~6.7.**
- **Reduced right lung volume.**

Head and Neck:

- Bilateral symmetrical FDG distribution is seen within the brain parenchyma with no abnormal metabolic activity or definite SOLs could be detected.

(N.B: it may kindly be noted that some brain lesions not to be apparent on PET/CT and MRI is better for local assessment, if clinically warranted).

- Normal appearance of the nasopharynx, oropharynx and larynx.
- Normal appearance of thyroid and salivary glands.
- No pathologically enlarged or dense tracer fixing cervical LNs seen.

Menopausal Status :		Reason of MDT :	querry dp
		MDT name::	

Medical Report

Diagnosis :	
Notes :	

History:	malignant pleural mesothelioma epithelioid type initial pet ct rt nodular pleural thickening rt hilar active in after 3 cycles alimta carboplatin pet ct rd of rt hilar and rt pleural activity pt rec up to 6 cycles alimta carboplatin ts on 25/8/2026: still noted rt circumferential pleural thickening sd of encysted effusion and rt hilar LN newly developed tiny foci of osteosclerosis in d7,d9,d11 and relatively thickened left adrenal gland likely to be metastatic in evolution ??? for mdt
Investigations:	
Recommendations:	
MDT DECISION:	For MRI e contrast to dorsal vv , abdomen to assess lt adrenal

Specialty	Surgery	Pathology	Radiology
-----------	---------	-----------	-----------

- No left pleural or pericardial effusion.
- Average size of the heart with normal CT of its big vessels.
- Tiny foci of osteosclerosis are newly-developed in D7,D9,D10,and D11.
- Average sized liver,measuring about 13.4 cm, showing a homogenous parenchymal attenuation and enhancement pattern.
- No sizable hepatic focal lesions or dilated biliary radicles.
- Patent PV.
- Average sized spleen,measuring about 9 cm. No focal lesions seen inside.
- Relatively thickened left adrenal gland.
- Normal CT appearance of the pancreas, both kidneys, right suprarenal gland, aorta and IVC.
- No sizable abdominal or pelvic lymphadenopathy.
- No ascites.
- No intra-vesical stones,solid masses,wall thickening or diverticulosis seen.
- The rest of the pelvic structures are unremarkable.

IMPRESSIONS:

A status follow up,and comparing with the previously-done examination dated at 18/05/2026, the current study shows:

- Hyperinflated left lung with reduced right lung capacity with circumferential nodular pleural thickening/effusion as well as the encysted effusion and the right hilar lymph node are still seen with no appreciable changes,denoting a stable course with newly-developed tiny foci of osteosclerosis in D7,D9,D10,and D11 and relatively thickened left adrenal gland,likely to be metastases in evolution.
- Linear atelectatic bands still seen scattering in the right lung.

Prof/Hanan El-Ahwal.

Dr.Hanan Alahwel
