Pathology Report

Path no: 364-26

Clinical data & Nature of specimen:

Right retroperitoneal mass, US guided biopsy.

Gross:

Multiple Fragmented greyish white tissue cores collectively measures 1.8x1.8 cm, totally submitted.

Microscopic:

Examination revealed cores of mass showed alternating hypo and hypercellularity formed of bland looking spindle cells. No evidence of significant atypia, mitosis or necrosis in sections examined.

Diagnosis:

Right retroperitoneal mass, US guided biopsy:

- Spindle cell neoplasm.
- Case is for mandatory immunophenotyping to start with (S100,SMA, Desmin, Ki67).
- Case is clinical and radiological correlation.

Received Date 13/06/2026 10:33 AM
Doctor

CLINICAL HISTORY

A 49 years old female patient presented with inoperable retroperitoneal mass and retroperitoneal lymphadenopathy. Slide revision of incisional biopsy from mass and lymph nodes.

GROSS DESCRIPTION

Three referred paraffin blocks, and Three referred Hx & E stained slides labeled by patient's name in Arabic and coded 1059157, additionally designated 1, 2 and C.B

MICROSCOPIC DESCRIPTION

Examination of the received slides revealed:

- 1- Sections of lymph nodes showing preserved nodal architecture with Reactive Follicular Hyperplasia and sinus histiocytosis. No evidence of malignancy
- 2- Tissue fragment with fibrosis and collagenous stroma, entrapping blood vessels surrounded by lymph plasma cell aggregates. No evidence of malignancy
- 3- The slide received designated (C.B) show fragmented cores formed of spindled cells, fibroblasts and aggregates of large polyhedral cells with granular foamy cytoplasm, ? foamy/lipid laden histiocytes. Occasional hemosiderin laden macrophages are noted with mixed inflammatory cells.

IMMUNOHISTOLOGY

Marker study done revealed positive reaction to S100 and SOX10, while negative for CD68.

DIAGNOSIS

Retroperitoneal mass, Slide revision of core biopsy and mass content: Scanty, Low grade spindle cell neoplasm of neuronal origin. Exact nature and behavior of the tumor cannot be assessed on such scanty biopsy. Correlation with radiologic findings and larger biopsy are advised.

Category

A definitive diagnosis could not be established

Patient Name : **هناؤ توفيق خطاب**

Analysis ID :  1059157

Age : 49 Y

Gender : Female

Conf. Code : 5603

Referred By Prof. Dr. : **محمد عبد الوالد**

Clinical Diagnosis : Inoperable retroperitoneal mass, retroperitoneal lymph node.

Nature of Specimen : Referred blocks and referred slides (retroperitoneal lymph node, mass wall incisional Biopsies and mass content cytology)

Receiving Date : 2026-05-19

Patient ID : 775419

PATHOLOGY REPORT

Gross :

Three blocks and three slides labeled as 26013062.

Microscopic :

Sections prepared from block (1) and examination of slide (1) received revealed multiple lymph nodes with preserved architecture, patent subcapsular sinus with many variably sized reactive follicles. The paracortex showed lymphoplasmacytic infiltrate.
No evidence of specific granuloma.

No evidence of malignancy.

Sections prepared from block (2) and examination of slide (2) received revealed fibrocollagenous tissue with moderate inflammatory reaction.

- Sections prepared from cell block(3) and examination of slide (3) received revealed cores of a tumor formed of bland spindle cells with oval and tapered nuclei in a fibrillary background showing intervening aggregates of xanthoma cells. No malignancy.

Diagnosis :

Inoperable retroperitoneal mass:

- 1- Retroperitoneal lymph node, Referred block and referred slide (Biopsy), **REACTIVE LYMPH NODES, CHRONIC LYMPHADENITIS.**
 - 2- Mass wall, Referred block and referred slide (Incisional biopsy), **FIBROCOLLAGENOUS TISSUE WITH MODERATE INFLAMMATORY REACTION.**
 - 3- Mass content, Referred cell block and referred slide(Cytology), **SPINDLE CELL NEOPLASM CONSIDER SCHWANNOMA.**
- CASE FOR IMMUNOPHENOTYPING FOR CONFIRMATION.
