IMMUNOHISTOCHEMISTRY REPORT

Clinical Data:

Left breast mass

Nature of the specimen:

Tru-Cut biopsy

Gross Examination:

Multiple greyish white tissue cores, up to 1cm. Totally submitted

Microscopic examination:

• Histological type: DCIS intermediate grade with focal calcification

• Lymph node involvement: N/A

• Resection Margins: N/A

Diagnosis:

Left breast mass; Tru-Cut biopsy:

DCIS intermediate grade with focal calcification

IHC:

ER: Strongly and diffusely positive only in DCIS. No invasive components

Pathology Report

Clinical Data: Ductal carcinoma insitu

Nature of the specimen: Simple mastectomy and sentinel lymph nodes.

Gross Examination: Two specimen were recieved and submitted as (1) Sentinel lymph nodes: (recieved in frozen section) Four nodules stained blue, the largest 1.3x0.7 cm.
(2) Left simple mastectomy: measure 20x18x3cm, nipple, areola un remarkable grossly, skin covering measure 20x15cm. Cut sections reveals multiple scattered granular grayish white tissue

- Procedure: Simple mastectomy and sentinal lymph nodes
- Localization: Left
- Lymph nodes number and size: Four LNs, up to 1.3x0.7 cm
- Frozen section: discribed in gross.

Microscopic examination:

- Histological type: Scattered foci of ductal carcinoma insitu, low grade.
- Grade : Low grade
- Angiolinvasion: No
- Ductal carcinoma in situ. Scattered foci
- Skin involvement: No
- Lymph node involvement: 0/4
- Resection Margins: free

Diagnosis

Left breast, Mastectomy and sentinel lymph nodes,

- Scattered foci of low grade ductal carcinoma in situ
- Free sentinel lymph nodes. (N0= 0/4)
- Free margins
- pTis(m) pN0

Pathology Report

NATURE OF SPECIMEN

U/S guided biopsy left breast mass.

GROSS PATHOLOGY

Fragmented yellowish white tissue pieces; 0.5 x 0.5 cm. Totally submitted.

HISTOPATHOLOGY

Section showed fragments of breast tissue with expanded hyalinized stroma, ectatic ducts with hyperplastic lining and a bland looking lobule.

DIAGNOSIS

U/S guided biopsy left breast mass: Feature of fibrocystic change.

COMMENT

Please correlate with the clinical and radiologic findings.

Supplementary Data: 54 years old female patient presented with left breast microcalcifications for further work up.

الاسم : حسيبة صبحي اسماعيل

التاريخ : ٢٠٢١/٧/٢٧

Dynamic Contrast Enhanced MRI Study of the Breast :

Pulse Sequences :

Pre-contrast axial T1,T2 ,STIR and Sagittal T2WIs.

Post-contrast axial VIBE and Subtraction WIs.

Indication of the examination:

- 54 years old female patient presented with left breast microcalcifications for further work up.

Report:

- Scattered fibro-glandular parenchymal (ACR B) with mild Background enhancement.
- The left breast shows upper outer quadrant regional non mass enhancement that corresponds to the groups of microcalcifications seen on the previous mammography is measuring 10 x 5 cm respectively in its maximum dimensions exhibiting intermediate signal intensity on T1 , low signal on T2 WI, bright on T1 fat sat images and DWIs, low on ADC map with regional no mass enhancement .
- On plotting the time signal intensity curve showing type 3 curve
- Normal nipple areola complex.
- Normal right breast.

OPINION:

- 54 years old female patient presented with left breast microcalcifications for further work up showing :-

Left breast upper outer quadrant regional non mass enhancement as described above (BIRADS IV) for histopathological correlation and further management.

Dr. Heba Nabil, M.D

Breast U/S

الاسم : حسنية صبحي

التاريخ : ٢٠٢١/٣/٢٨

Breast U/S: 54 years old lady with left breast UOQ suspicious microcalcifications by mammography.

- Condensed glandularity tissue in both breasts with no suspicious solid lesions.
- Right breast shows a small oval shaped isoechoic mass lesion measuring 0.46x0.22 cm noted at 3 o'clock position.
- Left breast shows a rather rounded nodule measuring 0.3 cm noted at 12 o'clock position.
- Left breast retroareolar dilated duct measuring 0.4 cm with calcifications noted inside yet no intra-ductal masses.
- Non specific axillary L.N.

Opinion:

- *Bilateral fibroadenosis, with small nodules as described, likely benign looking lesions, for follow up after 6 months (BIRADS 3).*
- *MRI breast with contrast is recommended for better assessment of the suspicious microcalcifications noted in previous mammogram.*

BIRADS reporting system:

- Category 0: Further evaluation is recommended.
- Category 1: Normal
- Category 2: Definite benign finding.
- Category 3: Probably benign finding.
- Category 4: Suspicious lesion, biopsy is a must.
- Category 5: Highly suggestive of malignancy, immediate intervention is advised.

Bilateral High Resolution Ultrasonography

Clinical Presentation:

- Follow up

Ultrasound Findings:

- Left UOQ regional macro calcification seen in mammography by ultrasound no underlying solid or cystic lesion is seen
- Right breast prominent fibro-glandular parenchymal with mottling appearance.
- No suspicious solid or cystic lesions seen.
- No definite signs of malignancy.
- Normal skin/nipple.
- Bilateral non specific preserved axillary lymph nodes are seen.

Conclusion:

- Left breast UOQ macrocalcification (mammography) (BIRADS 3) for close follow up after 6 months

DR.Marowa Hassan
