تقرير طبي

المريض

تحية طبية وبعد،،

بشأن تقرير طبي للمريض

إهداء للطبيب المقدم من

رقم طبي:

بقسم:

تنتهز هذه بان توضح لهما يلي تقريراً عن حالته

تاريخ ومساءة الخروج :
PM 01:17 05-07-2026

تاريخ ومساءة التحويل :
--- yyyy-mm-dd

وبعد الكشف والفحوصات والمتابعة وجد انه

المريض يعاني من لوكيميا لمفاويه حاده ويحتاج الى CT scan of the brain.

FLOW CYTOMETRY DIAGNOSIS

Bone Marrow: Mostly MRD- negative (<0.1%)

Comment:

Measurable residual disease (MRD) analysis is performed on the provided bone marrow sample of a patient known to have acute myelomonocytic leukemia (AML) under treatment.

Myeloblasts constitute about 2% of BM leukocytes.

CD14-negative monocytes, which correspond to monoblasts or promonocytes, constitute 1.2% of BM leukocytes.. According to the leukemia-associated immunophenotype (LAIP) identified at diagnosis (CD11C/CD34 coexpression, CD2 aberrant expression), no significant measurable residual disease can be identified.

Interpretation:

The sample is mostly MRD- negative (<0.1%). However, the presence of the immature monocytic component should be considered for close follow up.

Markers tested: CD2, CD11C, CD13, CD19, CD33, CD34, CD45, CD64, CD117, HLA DR.

Flowcytometry Report

Bone Marrow: C/W Acute Myeloid Leukemia AML (likely to be M4)

CD19	0.1%	Negative
CD7	1%	Negative
CD2	27%	Positive
CD14	1%	Negative
CD33	85%	Positive
CD13	63%	Positive
CD117	90%	Positive
CD56	3%	Negative
CD34	96%	Positive
HLA-DR	94%	Positive
CD11C	96%	Positive
CD10	1%	Negative
CD64	20%	Positive

Comment: Immunophenotyping is performed on the provided BM sample using CD45/SSC gating strategy. It reveals about 24% myeloblasts as listed in table. Along with ~70% monocytic population (express CD14, CD64, HLADR, CD11c, CD13, CD33 and negative to CD117 and CD34). This immunophenotype pattern is consistent with diagnosis of AML with monocytic component (likely to be M4). Integration with relevant cytogenetic and molecular test is mandatory.

Flowcytometry Report

Bone Marrow: C/W Acute Myeloid Leukemia AML (likely to be M4)

CD19	0.1%	Negative
CD7	1%	Negative
CD2	27%	Positive
CD14	1%	Negative
CD33	85%	Positive
CD13	63%	Positive
CD117	90%	Positive
CD56	3%	Negative
CD34	96%	Positive
HLA-DR	94%	Positive
CD11c	96%	Positive
CD10	1%	Negative
CD64	20%	Positive

Comment: Immunophenotyping is performed on the provided BM sample using CD45/SSC gating strategy. It reveals about 24% myeloblasts as listed in table. Along with ~70% monocytic population (express CD14, CD64, HLA-DR, CD11c, CD13, CD33 and negative to CD117 and CD34). This immunophenotype pattern is consistent with diagnosis of AML with monocytic component (likely to be M4). Integration with relevant cytogenetic and molecular test is mandatory.

Bone Marrow Aspiration

Bone Marrow Differential Count

Normoblasts :	35	Blasts :	3
Promyelocytes :	7	Myelocytes :	9
Juvenile :	9	Staf :	11
Segment :	8	Lymphocyte :	15
Monocyte :	0	Eosinophil :	3
Basophil :	0	Plasma cell :	0

Peripheral blood comment :

Normal TLC, anemia, Normal platelets.

Bone Marrow Aspiration / Touch Print Comment

Cellularity :

Hypocellular marrow for age

Erythropoiesis :

Normoblastic reaction with dysplasia

Granulopoiesis :

Normal granulopoiesis

Thrombopoiesis :

normal thrombopoiesis

Lymphopoiesis and plasma cells :

Normal lymphopoiesis and plasma cells.

Others :

Abnormal Infiltration :

No abnormal infiltration.

Conclusion :

Referred patient as AML follow up, bone marrow aspiration is hypocellular for age, patient is in morphological remission.

Recommendations :

Correlation with MRD

Dr. Hend Abd Elhady, M.D
Ass. Prof. of Hematopathology.

Bone Marrow Report

BMA Differential count :

Normoblast : 29
Blast : 1
Promyelocyte : 6
Myelocyte : 9
Juvenile : 4
Staff : 7
Segmented : 4
Lymphocytes : 40
Monocytes : 0
Eosinophils : 0
Basophils : 0
Plasma Cells : 0

P.B comment:

Normal TLC, Anemia , normal Plts

BMA Comment:

Mild hypocellular marrow
normoblastic reaction with some dysplasia
decreased granulopoiesis in count & normal morphology
normal megs & normal marrow platelets
Increased Lymphopoiesis
normal plasma cells
some broken cells were seen

Conclusion:

Referred patient as AML follow up, mild hypocellular marrow for age, patient is morphologic remission

Recommendation: correlation with MRD

FLOW CYTOMETRY DIAGNOSIS

Bone Marrow: Mostly MRD- negative (<0.1%)

Comment:

Measurable residual disease (MRD) analysis is performed on the provided bone marrow sample of a patient known to have acute myelomonocytic leukemia (AML) under treatment.

Myeloblasts constitute about 2% of BM leukocytes.

CD14-negative monocytes, which correspond to monoblasts or promonocytes, constitute 1.2% of BM leukocytes.. According to the leukemia-associated immunophenotype (LAP) identified at diagnosis (CD11C/CD34 coexpression, CD2 aberrant expression), no significant measurable residual disease can be identified.

Interpretation:

The sample is mostly MRD- negative (<0.1%). However, the presence of the immature monocytic component should be considered for close follow up.

Markers tested: CD2, CD11C, CD13, CD19, CD33, CD34, CD45, CD64, CD117, HLA DR.
