Contrast Enhanced Digital Mammography

Clinical summary: A 59 –year- old lady with left pathologically proven IDC, Grade II.

Technique

- MLO and CC views (low energy & recombined post contrast)
- Targeted High resolution ultrasound

Detailed Findings:

- **Density:** ACR B
- **Background Uptake:** Minimal

Left breast

- **Low energy (non-contrast images) show:** UOQ, middle third, irregular speculated high density mass lesion with marked surrounding distortion with no suspicious calcifications.
- **Recombined (post contrast) images show:**
 - UOQ corresponding heterogeneous mass enhancement measuring 3.3 x 2.7 x 3.3 cm seen 5.4 cm from nipple, 5 mm deep to the skin.
 - Associated faint linear posterior non-mass enhancement is noted measuring 3.2 cm in maximum dimension. By **targeted US** it is seen corresponding to a posterior large spicule. The overall pathological area measured 6.5 cm seen 5 cm from nipple.
- Normal skin/subcutaneous tissue.
- Non-specific axillary LNs.

Right breast

- **Low energy (non-contrast images) show:** UOQ non-specific intramammary LN. No asymmetry, distortion or suspicious calcifications.
- **Recombined (post contrast) images show:** no pathological mass or non-mass enhancement.
- Normal skin/subcutaneous tissue and nipple/areolar complex.
- Non-specific axillary LNs.

Impression:

- Left breast (BIRADS 6): Pathologically proven malignant UOQ malignant mass lesion as described.
- Right breast (BIRADS 2: benign findings): Non-specific UOQ intra-mammary lymph node.
