PATHOLOGY REPORT

Gross :

Fragmented grayish white tissue cores, the longest measured 1 cm, totally submitted.

Microscopic :

Serial sections examined from the specimen received revealed cores of tumour tissue formed of malignant ductal epithelial cells, showing moderate nuclear pleomorphism and hyperchromasia. There is poor attempt at tubular formation.

There are moderate number of mitotic figures.

There is marked desmoplasia.

There is peritumoural lymphocytic infiltrate around 5 %.

No necrosis.

No intraductal component

Diagnosis :

Left breast lesion, Core needle biopsy, INFILTRATING DUCT CARCINOMA, GRADE II.

IMMUNOHISTOCHEMISTRY REPORT

Technique :

Sections were prepared from the paraffin block, processed in Benchmark Ultra machine (Ventana) and stained by rabbit monoclonal antibodies using Ultra view HRP DAB as chromogen and hematoxylin as counter-stain.

The sections were treated against:

- Estrogen receptors - Progesterone receptors - Her 2 - Ki67.

Results :

90% of tumor cells show strong POSITIVE Staining for Estrogen receptors.

90% of tumor cells show strong POSITIVE Staining for progesterone receptors.

Sections treated for HER2 revealed MODERATE CONTINUOUS CELL MEMBRANE STAINING IN MORE THAN 10% OF TUMOR CELLS.

15% of Tumour cells are POSITIVE for Ki67.

Conclusion :

Block, TUMOUR CELLS ARE;

POSITIVE FOR ESTROGEN RECEPTORS (SCORE 8 / 8).

POSITIVE FOR PROGESTERONE RECEPTORS (SCORE 8 / 8).

→ HER 2 EQUIVOCAL, SCORE 2+.

- CASE FOR CONFIRMATION OF HER 2 GENE AMPLIFICATION BY SISH TECHNIQUE.
THE PROLIFERATION INDEX OF Ki67 IS 15%.
