**MULTI-DETECTOR C.T. EXAMINATION OF THE CHEST,
ABDOMEN AND PELVIS FOLLOWING ORAL AND
INTRAVENOUS CONTRAST MEDIA ADMINISTRATION
REVEALED:**

- Clinical data: breast cancer

- A Well-defined cystic hepatic lesion at segment II measuring 7.5x8.5 c with no solid component and no contrast enhancement ... Benign cystic lesion

- Multiple mixed lytic and sclerotic osseous lesion at the dorsal and lumbar vertebral bodies.... metastatic bone deposits

Otherwise;

- Normal lung parenchyma, showing no focal lesions.

- Normal vascular mediastinal structures.

- The trachea, main stem bronchi as well as their lobar and segmental divisions are normal.

- No evidence of mediastinal or hilar nodal enlargement .

- No pleural collections.

- No detectable lesions in the chest wall.

- The intra and extra-hepatic biliary radicles are normal.

- The pancreas and spleen are normal.

- Normal CT features of both kidneys.

- Right and left supra renal glands are normal.

- No CT evidence of enlarged abdominal or pelvic lymph nodes.

- No ascites.

- Scans through the pelvis showed no masses.

Opinion

- Hepatic cyst at left hepatic lobe
- Multiple lytic and sclerotic deposits

Much Obligated;
Dr.Khaled Moghazy,MD
Prof.of Radiology

وبعد الكشف والفحوصات والمتابعة وجد انه			
The patient is receiving Arimidex and Zoladex, with Zoladex scheduled for administration on 18/01/2026, and will commence Zometa today. The patient has a history of left breast carcinoma that was locally advanced, estrogen receptor and progesterone receptor positive, and HER2 2+ amplified on SISH. Neoadjuvant chemotherapy was administered, followed by a left total mastectomy in August 2024. The patient had 2 positive axillary nodes (YPN3) and 19 positive sentinel nodes (YPT2 10/19). Post-operative adjuvant therapy included PHESGO until December 2024, after which the patient transitioned to Arimidex and Zometa at the day-care pharmacy. Arimidex was started today, with the next visit scheduled in one month for Zoladex. Arimidex and supplemental therapy were initiated today, with a 3-month course of Zoladex planned; the next visit is scheduled in three months.

Tc^{99m} MDP SKELETAL SCINTIGRAPHY

History

- A 55-year-old patient, with history of right breast cancer and referred for metastatic workup.

Technique

- Anterior and posterior whole body scans were acquired 2 hours post injection of the tracer.

Findings

Compared to the prior study dated 3-11-2025;

- Newly seen mild tracer uptake at the level of DV11, LV1, LV2
- Still seen residual tracer uptake at left humeral head and few bilateral ribs
- No other abnormal active or cold focal bony lesions that could account for metastatic bone disease.
- Degenerative changes are noted at the spine and big joints.

Impression:

- Still seen residual active osseous lesions at left humeral head and few bilateral ribs.
- Newly seen/reactivated few vertebral lesions.

Best regards,

Dr. Alaa Nagi, MD
Nuclear Medicine

^{99m}Tc MDPSKELETAL SCINTIGRAPHY

History

- A 54-year-old patient, with history of breast cancer and referred for follow up.

Technique

- Anterior and posterior whole-body scans were acquired 2 hours post injection of the tracer.

Findings

- Compared to the prior scan dated 23/08/2025; still noted residual active lesions at left humeral head and bilateral ribs.
- No other abnormal active or cold focal bony lesions that could account for metastatic bone disease.
- Degenerative changes are noted at the spine and big joints.

Impression:

- Rather stationary residual metastatic osseous lesions as described.

Pathology Report

Clinical Data: Left humeral soft tissue mass .

Nature of Specimen: Tru-cut biopsy, collected at 13/03/2025.

Gross Examination:

- Four grayish white tissue cores up to 1 cm, totally submitted.
- Sections prepared from paraffin block for immune-staining using Bench Mark ULTRA system for ER, PR, Her2, ER clone (1E2), PR clone (SP1), Her2 clone (4B5), Ki67 clone (30-9) , & GATA3 clone (L50-823)

Microscopic Examination:

- * Histological type: Metastatic adenocarcinoma.
- * IPT (Positive control showed appropriate reactivity):
- GATA3: Positive in tumor cells.
- ER: Moderate nuclear reaction in 50% of tumor cells (score 6/8).
- PR: Moderate nuclear reaction in 50% of tumor cells (score 6/8).
- Her2: No membrane reaction in the tumor cells (score 0).
- Ki67: 15% nuclear reaction of tumor cells.

Diagnosis:

Left humeral soft tissue mass, Tru-cut biopsy:

Metastatic adenocarcinoma of breast origin .

IPT:

- GATA3 : Positive.
- ER: Positive (score 6/8).
- PR: Positive (score 6/8).
- Her2: Negative (score 0).
- Ki67: Positive in 15% of tumor cells.

Pathology Report

* Scoring system "ER, PR"

ASCO-CAP ER/PR Test Guideline Recommendations. proportion of cells staining (0, no staining; 1, $>1\%$; 2, between 1% and 10%; 3, between 11% and 33%; 4, between 34% and 66%; and 5, between 67%-100% of the cells staining). Intensity of positive tumor cells (0, none; 1, weak; 2, intermediate; and 3, strong). Total score from 0 to 8

* Scoring system: "Her2"

Reference: ASCO-CAP Her2 Test Guideline Recommendations. 2013 IHC 0: as defined by no staining observed or membrane staining that is incomplete and is faint/barely perceptible and within $< 10\%$ of the invasive tumor cells. IHC 1+: as defined by incomplete membrane staining that is faint/barely perceptible and within $< 10\%$ of the invasive tumor cells. IHC 2+: based on circumferential membrane staining that is incomplete and/or weak/moderate and within $< 10\%$ of the invasive tumor cells or complete and circumferential membrane staining that is intense and within $< 10\%$ of the invasive tumor cells. IHC 3+: based on circumferential membrane staining that is incomplete, intense $< 10\%$ of tumor cells.

Patient Name: Asif Sajid Ahmed Naza Date: 21/11/2025
 Age: 34 Sex: M Ref: Asif Naza
 Medical History: Known case of right breast cancer

POST-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN & PELVIS

Findings:

CHEST compared to last study 5/3/2025

- Right breast: operative bed still shows defined irregular shaped soft tissue density lesion resting over the chest wall muscles ? scarring ? recurrence, measures 34 x 22 mm.
- Few left axillary level I and II subcentimetric lymph nodes.
- No appreciable changes regarding subcentimetric left supra-clavicular lymph node measures about 9x6 mm 0.7x0.5cm.
- Still noted right lower lung lobe posterior segment tiny partially calcified pulmonary nodule about 4 mm.
- Right upper and middle lung lobes subpleural reticulations and faint ground glass opacities, likely post radiation sequel.
- Left basal atelectatic bands are noted.
- No pathological hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, thickening or masses seen.
- Average cardiac size. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

II Abdomen & pelvis:

• Compared to the previous study dated 20/7/2025, the current study revealed:

- The liver seen mildly enlarged with homogenous CT texture still showing hypodense rather cystic focal lesion occupying segment II and III, no appreciable changes measures about 7.9 x 7.8 x 8.1 cm (compared to 8x7.8x8.5 cm), showing thin septations.
- No intra-hepatic or extra-hepatic biliary radicle dilatation.
- Normal size (11.5 cm) and parenchymal texture of the spleen with no sizable focal lesions seen. Still noted two splenules.
- Normal size, parenchymal thickness and density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas and both supra renal glands.
- Still noted multiple subcentimetric abdominal lymph nodes (para-aortic, mesenteric, right common iliac, left external iliac and bilateral inguinal).
- No ascites.

- Average filling of the urinary bladder with no definite stones or masses.
- No gross adnexal lesions.
- Still noted widespread axial and appendicular skeleton lytic lesions with no associated soft tissue component or structural vertebral collapse.

Opinion:

- Overall Stationary course since the last study

**RIGHT DIGITAL SOFT TISSUE MAMMOGRAPHY WITH HIGH RESOLUTION
SONOGRAPHY REVEALED:**

CLINICAL SUMMARY:

Left MRM

FINDINGS:

RIGHT BREAST:

Scattered fibro-glandular densities, (ACR b).
No spiculations, masses, asymmetry, distortion or suspicious microcalcifications.
UOQ IMLN, complementary US demonstrated intramammary lymph node at 10 oclock zone C measuring 8 x 6 mm with cortical thickness of 3.5 mm
no solid or cystic lesion.
Normal skin/nipple/areola complex.
Non-specific axillary nodes.

LEFT MASTECTOMY BED.

Clear mastectomy bed with no masses or fluid collections.
No pathological regional lymph nodes.

CONCLUSION:

- Right breast (BIRADS 3): UOQ IMLN, as described for follow up
- Clear left mastectomy bed
