| وبعد الكشف والفحوصات والمتابعة وجد انه<br>The patient received phesgo at cycle 17 together with hormonal therapy; this represented the last cycle of phesgo and the plan was to continue hormonal treatment thereafter.<br>The patient has a history of primary right-sided breast cancer, clinical stage T4b N2, with estrogen receptor (ER) 8/8, progesterone receptor (PR) 8/8, and HER2-positive disease. The tumor was classified as recurrent (REC) and treated with a taxane-cyclophosphamide-herceptin-pertuzumab (TCHP) regimen initiated on 14 January 2025, followed by radiation therapy to the breast (RT MRM). Ongoing systemic therapy includes Zoladex (goserelin) and Femara (letrozole) started in February 2025, with the patient having completed 16 cycles of phesgo, the last administered in December 2025, to support the Zoladex and Femara regimen.<br>The patient presented for administration of phesgo at cycle 17, continuation of Femara, and supplemental therapy as indicated.<br>The patient continued Femara and supplemental therapy, and received a three-month supply of Zoladex during today's visit, which occurred after a three-month interval since the prior assessment. |                       |                                                                                     |

### Pathology Report

#### Clinical Data

Multicentric right breast cancer

#### Nature of specimen

Block & slide revision

#### Gross examination

One block labelled by (3478/24) & 3 slides were received

IHC technique: Sections prepared from paraffin block for immune-staining using Bench

Mark ULTRA system for ER, PR, HER2, ER clone (1E2), PR clone (SP1), HER-2 clone (4B5), & Ki67 clone (30-9).

#### Microscopic examination

- \* Histological type: Invasive duct carcinoma
- \* Grade (differentiation +nuclear pleomorphism+ mitosis): (3+3+2) Grade III
- \* DCIS: No
- \* Angioinvasion: Couldn't be detected in the received biopsy
- \* Perineural invasion: No
- \* IPT ( Positive control showed appropriate reactivity ) :
- \* ER: Strong nuclear reaction in 80 % tumor cells (Allred score 8/8)
- \* PR: Strong nuclear reaction in 80 % tumor cells (Allred score 8/8)
- \* HER2: Strong complete membrane reaction in >10 % of tumor cells (score 3+)

#### Diagnosis

Multicentric right breast cancer, Block & slide revision:

### Pathology Report

#### Clinical Data :

Right breast cancer post NACT.

#### Nature of the specimen :

Right nipple sparing mastectomy specimen collected at 14/1/2025.

#### Gross Examination:

- Right nipple sparing mastectomy specimen measured 20x17x3 cm with no covering skin ellipse .

• Tumor extent : An ill defined rubbery greyish white tumor bed site.

• Size: 4.5x4x2 cm .

• Distance from margins: 1.5 cm away from deep margin .

• Lymph node involvement: 12 nodes up to 2x1 cm.

• Additional pathologic findings:

Rest of breast show a rubbery grey white cut section on an area measured 4x4x4 cm.

• Frozen section:

- Free nipple bed and superficial margin.

• Gross key:

1) Nipple bed.

2) Superficial margin.

3) Deep margin.

4-8) Tumor bed site.

9-12) Rubbery grey white area.

13-17) Lymph nodes.

Gross was done by Dr. Toka Medhat.

#### Microscopic examination:

• Total tumor regression in a previously diagnosed carcinoma.

### Pathology Report

- Therapy effect in form of fibrosis and hyalynosis and microcalcifications.
- Grey white area show fibrocystic changes and a mcroscopic papilloma.
- Resection Margins: Free nipple bed, superficial and deep margins.
- Lymph node involvement: Free (0/12).
- Histologic response to therapy: Pathologic complete response .

#### Diagnosis:

Right breast cancer post NACT , nipple sparing mastectomy with axillary clearance specimen :

- Total tumor regression in a previously diagnosed invasive carcinoma.
- Free nipple bed, superficial and deep margins.
- Free lymph nodes: (0/12) .
- Pathologic complete response.
- Stage : ypT0 , ypN0.

PATIENT NAME: RANYA AHMED ALI GAB ALLAH

GENDER: Female

DATE : 13-Jul-2024 11:18 AM

PATIENT ID: 10124243619

AGE: 40 y

ORDER: 2901757,2901758

**POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN  
AND PELVIS WITH TRIPHASIC CT STUDY OF THE LIVER****TECHNIQUE:**

- Multislice helical CT acquisition with automatic IV low osmolar non-ionic contrast medium infusion 50 ml.

**FINDINGS:****\*\*Reported case of breast cancer.****1-CHEST**

- Right breast lower inner quadrant few (about 2) enhancing soft tissue lesions, the larger measuring 4.1 x 4.3 cm along its maximum axial dimensions. Overlying skin thickening is noted.
- Multiple pathologically enlarged right axillary level I and II lymph nodes, the largest is seen at level I, measuring 2.3 x 3.2 cm along its maximum axial dimensions.
- No sizable pulmonary nodules, masses, areas of consolidation or cavitory lesions.
- Right upper lung lobe, middle lobe and lingular atelectatic bands.
- Right lower lung lobe small air-filled cyst.
- No CT evidence of pathologically enlarged hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Aberrant right subclavian artery (variant).

**2- ABDOMEN AND PELVIS**

- The liver is of average size with homogenous low parenchymal attenuation. No focal lesions or intra-hepatic or extra-hepatic biliary radicles dilatation.
- Patent homogeneously enhancing portal vein and its main branches as well as its main tributaries.
- Small radiodense gallbladder stone.
- Normal appearance of the pancreas, spleen, kidneys, adrenals, aorta,

PATIENT: RANYA AHMED ALI GAB ALLAH, 10124243619, Female, 40 y

and I.V.C.

- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- No pathologically enlarged abdominal or pelvic lymph nodes.
- Mild pelvic ascites.
- Small fat containing umbilical hernia.
- **The revised bone window revealed:**
  1. Bilateral pelvic bones few small patchy sclerotic lesions (likely bone islands).
  2. No CT evidence of vertebral collapse or extra-osseous soft tissue component.

**Opinion:**

**\*\*Reported case of breast cancer.**

- Right breast lower inner quadrant neoplastic lesions associated with pathologically enlarge right axillary lymph nodes.
- No evidence of pulmonary or hepatic metastatic deposits.

### FULL FIELD DIGITAL MAMMOGRAPHY AND COMPLEMENTARY ULTRASOUND

#### INDICATION:

- 40 years complains of right breast lump

#### TECHNIQUE:

- CC and MLO view.
- Complementary ultrasound

#### REPORT:

- Dense heterogeneous breast parenchyma that may obscure small masses (ACR c).
- **LEFT BREAST:** Multiple tiny nodules and layered calcifications seen scattered within the breast parenchyma, with one located UIQ (arrows) shows amorphous calcifications.
- Ultrasound revealed multiple scattered anechoic cysts as well as the UIQ cyst with internal echogenic contents and no vascularity on color Doppler application measuring 6mm diameter located at 11 o'clock.
- Left normal skin thickness and contour.
- Left normal nipple areola complexes.
- Left nonspecific axillary lymph nodes.
- **RIGHT BREAST:** LIQ two irregular shape dense masses with overlying microcalcifications, and skin thickening are seen.
- Ultrasound revealed corresponding 5 o'clock two irregular shape heterogeneous hypoechoic vascular masses, the more posterior one seen abutting the muscle measuring about 2.9x 2.6x 2.3cm, and the other more anterior mass measured 4.7x 2.2cm, located about 1.7cm from the nipple.
- UOQ ill-defined area of altered shadowing parenchyma is seen.
- Multiple (more than 4) pathological (level I & II) axillary lymph nodes are seen, the largest measured 2.7x 2.5cm.

#### OPINION:

- Left fibrocystic changes with 11 o'clock ?tiny complicated cyst (BIRADS 3).
