Pathology Report

Clinical Data: Right breast multicentric malignant masses reaching nipple and skin, with right axillary tail mass.
Nature of Specimen: Tru-cut biopsy, collected at 21/01/2025, 12:37 pm.

Gross Examination:
1- Right para-areolar mass:
- Multiple grayish white tissue cores up to 1.2 cm, totally submitted.
2- Right axillary tail mass:
- Three grayish white tissue cores up to 0.5 cm, totally submitted.
- Sections prepared from paraffin block for immune-staining using Bench Mark ULTRA system for ER, PR, Her2, ER clone (1E2), PR clone (SP1), Her2 clone (4B5), & Ki67 clone (30-9).

Microscopic Examination:
1- Right para-areolar mass:
* Histological type: Invasive duct carcinoma.
* Grade (differentiation+ nuclear pleomorphism+ mitosis): (2+2+2) Grade II.
* Ductal carcinoma in situ: DCIS (solid and cribriform pattern).
* Perineural invasion: Not detected.
* Angioinvasion: Not detected.
* Microcalcifications: Not detected.
* IPT (Positive control showed appropriate reactivity):
- ER: Strong nuclear reaction in 85% of tumor cells (score 8/8).
- PR: Strong nuclear reaction in 95% of tumor cells (score 8/8).
- Her2: No membrane reaction of tumor cells (score 0).
- Ki67: 20% nuclear reaction of tumor cells.
2- Right axillary tail mass:
* Histological type: Desmoplastic cores showing Invasive duct carcinoma.

Pathology Report

* Scoring system: "ER, PR"
ASCO-CAP ER/PR Test Guideline Recommendations: proportion of cells staining (0, no staining; 1, >1%; 2, between 1% and 10%; 3, between 11% and 33%; 4, between 34% and 66% and 5, between 67%-100% of the cells staining). Intensity of positive tumor cells (0, none; 1, week, 2, intermediate; and 3, strong). Total score from 0 to 8.
* Scoring system: "Her2"
Reference: ASCO-CAP Her2 Test Guideline Recommendations, 2013.IHC 0: as defined by no staining observed or membrane staining that is incomplete and is faint/barely perceptible and within < 10% of the invasive tumor cells. IHC 1+: as defined by incomplete membrane staining that is faint/barely perceptible and within < 10% of the invasive tumor cells. IHC 2+: based on circumferential membrane staining that is incomplete and/or weak/moderate and within < 10%of the invasive tumor cells or complete and circumferential membrane staining that is intense and within < 10% of the invasive tumor cells. IHC 3+: based on circumferential membrane staining that is incomplete, intense < 10% of tumor cells.

GUSTAVE ROUSSY INTERNATIONAL EGYPTE

Patient's Name:	**EHSAN EMABABY AHMED HARB**
Date:	**2026-04-06**
Referred by:	Prof.Dr. CT CAP IV
Hospital:	**Goustave Roussey International Egypt**

MULTISLICE POST CONTRAST CT SCAN OF THE CHEST, ABDOMEN AND PELVIS:

TECHNIQUE: Multislice axial CT images of the chest, abdomen and pelvis obtained from the lower neck to the symphysis pubis with multiplanar reconstruction. IV contrast was used.

FINDINGS:

Clinically reported right breast carcinoma , compared to last study dated on 28/3/2025

(I) Chest:

- **Right breast regression of size of spiculated mass 2.3 x2.3 cm compared 2.2 x 6 cm , attached to skin with retraction .**
- **Stationary course of enlarged right axillary lymph odes , the largest measures 19 mm.**
- **Clear both lung fields .no sizable pulmonary masses or consolidation patches**
- **No pleural or pericardial collections seen.**
- **No gross cardiac abnormality.**

(II) Abdomen and pelvis:

- **The liver is enlarged in size showing homogenous CT density , no focal lesions**
- **Patent and homogenously enhancing portal vein.**
- **No intra or extra hepatic biliary radicles dilatation**

CT Scan

GUSTAVE ROUSSY
INTERNATIONAL
EGYPTE

Patient's Name:	**EHSAN EMABABY AHMED HARB**
Date:	**2026-04-06**
Referred by:	Prof.Dr. CT CAP IV
Hospital:	**Goustave Roussey International Egypt**

- **Normal CT appearance of the pancreas, both kidneys, aorta and IVC.**
- **Normal CT appearance of the spleen .**
- **Regular filling of the urinary bladder showing no stones, masses .**
- **Unremarkable other pelvic organs.**
- **No retro-crural, para-aortic or pelvic lymphadenopathy.**
- **No ascites.**
- **D7, D8, L8 and left iliac bone sclerotic lesions with D7 structural collapse .**

OPINION

- **Regressive course of right breast mass**
- **Progressive course of spread of sclerotic bony lesion for correlation with bone scan .**
- **D7 collapse .**

ISOTOPIC BONE SCAN REPORT

- **Indication:** 43-year-old female with history of breast carcinoma, presenting with bone aches. Evaluation for possible osseous metastatic disease.
- **Prior Study (02/06/2025):** Active osseous lesions at DV7, left 7th rib posteriorly, and mid right humeral shaft; consistent with few metastatic osseous lesions (prior images not provided for comparison).
- **Imaging Protocol:** Whole-body planar images (anterior and posterior projections) acquired approximately 2–3 hours post intravenous injection of the tracer (Tc-99m MDP).

FINDINGS:

Compared to the prior study, there is mild progression of metastatic bone disease:

- **Previously documented lesions (persistent):** DV7, left 7th rib posteriorly, mid right humeral shaft.
- **New lesions:** Sternum, left humeral head, left sacroiliac region (lower end), distal shaft of the right femur.
- **Incidental findings:** Age-related degenerative/arthritic changes in the spine and weight-bearing joints.

IMPRESSION:

- **Mild progression of metastatic bone disease** with new lesions identified in the sternum, left humeral head, left sacroiliac region, and distal right femur.
- Prior osseous lesions remain active.
- **For clinical correlation and follow-up as indicated.**

Much oblige
Dr. Alaa Nagi, MD

MULTISCLICE POST CONTRAST C.T. EXAMINATION OF THE NECK, CHEST, ABDOMEN AND PELVIS AFTER ORAL AND I.V. CONTRAST INJECTION REVEALED:

Known case of breast CA.

I- NECK:

- Normal appearance of the naso-, oro- and hypopharynx with preserved parapharyngeal fat planes.
- Intact laryngeal skeleton with no glottic, supra or infra glottic masses.
- Normal course and calibre of the carotid and jugular vessels.
- Normal CT appearance of the submandibular and parotid salivary glands showing homogenous enhancement. No focal solid or cystic lesions.
- Multiple subscentemetric bilateral upper deep cervical and submandibular LNs are noted; likely non-specific.
- No pathologically enlarged cervical lymph nodes.

II- CHEST:

- Right breast lesion measuring 33 x 20 mm with few right axillary lymph nodes largest measuring 12 x 12 mm for sono-mammography.
- Tiny left apical calcified pulmonary nodule.
- No pulmonary masses or cavitary lesions.
- No consolidation or collapse.
- No hilar or mediastinal masses or lymph node enlargement.
- No pleural or pericardial collection.
- Normal CT appearance of the heart and great vessels.

III- ABDOMEN AND PELVIS:

- Average sized liver showing homogenous parenchymal attenuation. No hepatic focal lesion or dilated biliary radicles.

Patient Name: Ehanan Embaby Ahmed	Date : 28/03/2025
Exam : C.T CHEST WITH CONTRAST	Age : 42 Year(s)
Medical ID: 716/2025	Pat. ID: 98635

POST-CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN AND PELVIS:

- **Reported case of right breast cancer.**

I Chest:

- Both breasts are partially out of examination field.
- Right breast UIQ irregular skin attached mass lesion measuring 2.2 X 6 cm with focally thickened skin.
- Enlarged right axillary level I and II lymph nodes reaching 1.9 cm.
- Few right upper lung lobe nodules reaching 3mm.
- No sizable pulmonary masses, consolidation or cavitary lesions.
- No CT evidence of pathological mediastinal lymph node enlargement.
- No pleural or pericardial collection, pleural thickening or masses.
- No cardiac gross enlargement.

II Abdomen & pelvis:

- Average sized liver showing homogenous parenchymal attenaution. No sizable focal lesions.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal CT appearance of the spleen, pancreas, kidneys, suprarenal glands, aorta and IVC.
- Averagely filled urinary bladder showing no sizable diverticular outpouching.
- No pathological abdominal or pelvic lymph node enlargement.
- No ascites.
- Right Ischial sclerotic area.
- D7 lytic destructive lesion with suspected intraspinal extra-osseous soft tissue component.
- Few left humeral head lucent foci.

Opinion:

Reported case of right breast cancer revealed:

- **Few right pulmonary nodules mostly non specific for follow up.**
- **D7 lytic lesion mostly metastatic.**
- **Right Ishial and left humeral lesions for bone scan.**
- **No sizable hepatic lesions.**

- Both kidneys are normal site, average sized and showing smooth regular cortical outline and preserved parenchymal thickness and function. No stones or back pressure changes.
- Normal C.T appearance of the spleen, pancreas, suprarenal glands, aorta and IVC.
- The urinary bladder shows no evidence of gross masses or diverticulae or stones.
- Normal appearance of the pelvic organs with no pelvic masses or collections.
- No abdominal or pelvic lymphadenopathy.
- No ascites.
- Multiple scattered axial and appendicular skeleton sclerotic bone lesions.

Opinion:

- **Tiny left apical calcified pulmonary nodule likely inflammatory/ granulomatous.**
- **Multiple sclerotic axial and appendicular skeleton bone lesions for bone scan.**
- **No pulmonary or hepatic metastatic lesions.**

Kindly arrange for
Comparison with last 4/2026
