Detailed Medical Report

السيد

تحية طيبة وبعد,,

إيماء للطلب المقدم من		**بشأن تقرير طبي للمريض**	
بقسم:		**رقم طبي:**	

ننشرف بأن نوضح فيما يلي تقريرا عن حالته

تاريخ وساعة الدخول : | **تاريخ وساعة الخروج :**

وبعد الكشف والفحوصات والمتابعة وجد انه

The patient underwent a multidisciplinary team (MDT) discussion in May 2026, during which the decision was made to initiate neoadjuvant chemotherapy (NACT) with AC (doxorubicin 100 mg/m² and cyclophosphamide 1000 mg/m²) for four cycles followed by taxotere for four cycles after clip insertion and breast-conserving surgery (BCS) with axillary lymph node dissection (ALND).

In June 2026, the patient was diagnosed with right breast cancer (clinical stage II, T2 N1 M0) with histology IDC, ER 8/8, PR 6/8, HER2-negative, Ki-67 35%. Imaging revealed a 28 × 4.5 × 4.5 mm mass in the right upper outer quadrant (RUQ) and indeterminate axillary lymph nodes. Physical examination confirmed a 4 × 5 cm RUQ mass. The MDT recommended 4 cycles of AC followed by BCS, with clip placement for future localization. The patient received the first cycle of AC (doxorubicin 100 mg/m², cyclophosphamide 1000 mg/m²) and endoxan 1000 mg, with echocardiography showing a left ventricular ejection fraction of 69 % and weight 69 kg, height 159 cm, BMI 1.74. The patient was also started on adjuvant adria 100 mg and endoxan 1000 mg.

On 16 June 2026, the patient completed the first cycle of AC with adria 100 mg and endoxan 1000 mg. Echocardiography remained stable at 63 % ejection fraction. Laboratory values from the previous week were acceptable.

On 7 July 2026, the patient presented with a 3 × 3 cm mass in the right lower outer quadrant (RLOQ) with skin dimpling. The patient received the second cycle of AC (adria 100 mg, endoxan 1000 mg) and had neoadjuvant clips inserted for future localization.

On 28 July 2026, the patient received the third cycle of AC (adria 100 mg, endoxan 1000 mg). The RLOQ mass measured 2 × 2 cm or less. The patient experienced neutropenic fever after the first and second cycles and was given prophylactic neubogen twice.

On 18 August 2026, the patient received the fourth cycle of AC. Laboratory results from three days prior were acceptable. The patient was prescribed methabiogen and scheduled for the next visit.

On 8 September 2026, the patient was examined and found to have a 1 × 2 cm mass in the RLOQ. The patient began the first cycle of taxotere neoadjuvant therapy at 110 mg (10 % dose reduction) and was assessed for tolerability. The patient's weight was 60 kg, height 159 cm, BMI 1.6. The patient has completed 4 cycles of AC and 1 cycle of taxotere to date.

Pathology Report

linical Data: Right breast UOQ mass.
ature of Specimen: Tru-cut biopsy, collected on 15/3/2026, at 1:15 pm. Cold ischemia time 20 seconds.

ross Examination:
our grey white tissue cores, ranging in size between 0.2 cm & 1.3 cm long, totally ubmitted.

icroscopic Examination:
Histological type: Invasive duct carcinoma.
Grade 2 (differentiation 2, nuclear pleomorphism 2, mitosis 2).
Ductal carcinoma in situ: Absent.
Perineural invasion: Absent.
Angioinvasion:Absent.
Microcalcification: Absent.

iagnosis:
ight breast mass, Tru-cut biopsy:
nvasive duct carcinoma, Grade 2.
For further IHC (ER, PR, Her2, Ki67).

IMMUNOHISTOCHEMISTRY REPORT

cal Data: Right breast UOQ mass, diagnosed "Invasive duct carcinoma grade 2".
ıre of Specimen: Tru-cut biopsy, collected on 15/3/2026, at 1:15 pm. Cold ischemia time is 20 ɔnds.

ınique:
ctions prepared from paraffin block for immune-staining using Bench Mark ULTRA system for; clone (1E2), PR clone (SP1), Her2 clone (4B5), & Ki67 clone (30-9).

ılts:
(All controls showed appropriate reactivity):
: Strong nuclear reaction in 95% of tumor cells (score 8/8).
: Strong nuclear reaction in 30% of tumor cells (score 6/8).
r2: Faint incomplete membrane reaction in more than 10% of tumor cells (score 1+).
7%: 35%.

clusion:
t breast mass, Tru-cut biopsy:
asive duct carcinoma, Grade 2.

: Positive (score 8/8).
: Positive (score 6/8).
-2: Low (score 1+).
7%: 35%.

ɔring system: "ER, PR"
O-CAP ER/PR Test Guideline Recommendations: proportion of cells staining (0, no staining; 1, ; 2, between 1% and 10%; 3, between 11% and 33%; 4, between 34% and 66%

BILATERAL DIGITAL SOFT TISSUE MAMMOGRAPHY WITH HIGH :RESOLUTION BREAST SONOGRAPHY REVEALED

CLINICAL SUMMARY:
RIGHT breast palpable lump

FINDINGS:

RIGHT BREAST:

- Scattered fibroglandular density , (ACR b).
- UOQ speculated dense mass
- Ultrasound demonstrated an irregular hypoechoic speculated mass at 10 oclock, 7 cm from the nipple, measuring 2.8 x 4.5 x 4.5 cm , with marked internal vascularity
- A level I axillary node is seen with cortical thickness reaching 4.7 mm, indeterminate.
- No suspicious supraclavicular or infraclavicular lymph nodes

Left BREAST:

- Scattered fibroglandular density , (ACR b).
- No mass, spiculation or suspicious micro calcifications, this was further confirmed by and U/S examination which depicted mottled parenchyma.
- Normal skin/nipple/areola complex.
- Non specific axillary nodes are noted.

CONCLUSION:
Right breast (BIRADS 4c): UOQ suspicious mass as described for histopathological correlation
Left breast (BIRADS 1): normal
