MULTISLICE POST CONTRAST CT SCAN OF THE CHEST ABDOMEN AND PELVIS:

TECHNIQUE: Multislice axial CT images of the chest, abdomen and pelvis obtained from the lower neck to the symphysis pubis with multiplanar reconstruction. IV contrast was used.

FINDINGS: As compared to last study dated on 2/8/2025

(I) Chest:

- **Right mastectomy with clear operative bed , no masses or collection .**
- **Right upper lobe and middle lobe subpleural reticulations likely post radiotherapy.**
- **Still noted bilateral tiny pulmonary nodules , the largest at right lower lobe anterior segment measures 5mm .**
- **Patent central air ways with well inflated both lungs.**
- **Both lung fields are clear showing no parenchymal nodules, cavitary lesions, consolidative patches or bronchiectatic changes.**
- **No CT evidence of hilar or mediastinal lymph node enlargement.**
- **No pleural or pericardial collections seen.**
- **No gross cardiac abnormality.**

(II) Abdomen and pelvis:

- The liver is average in size showing homogenous CT density with no enhancing focal lesions
- Patent and homogenously enhancing portal vein.
- No intra or extra hepatic biliary radicles dilatation.
- Normal CT appearance of the spleen, pancreas, suprarenal glands, both kidneys, aorta and IVC.
- Regular filling of the urinary bladder showing no stones, masses or diverticulae.
- Unremarkable other pelvic organs.
- No retro-crural, para-aortic or pelvic lymphadenopathy.
- No ascites.

- **(III) Examined skeleton:,**
  - Still noted widespread sclerotic lesion of dorsolumbar , sternum , both iliac bone right sacral ala and left pubic bone
  - No vertebral structural collapse or wedging.

OPINION:

Rather stationary course since the last study dated 2/8/2025

Tc^{99}m MDPSKELETAL SCINTIGRAPHY

History

- A 42-year-old lady, with history of right breast cancer and referred for follow up.

Technique

- Anterior and posterior whole-body scans were acquired 2 hours post injection of the tracer.

Findings

Compared to the prior bone scan dated 21-07-2025;

- Still noted enhanced tracer uptake at DV3, DV12 and left sacro-iliac region.
- No other abnormal active or cold focal bony lesions that could account for metastatic bone disease.
- Degenerative changes are noted at the spine and big joints.

Impression:

- **Stationary course of the few active (metastatic) osseous lesions as described.**
- **The rest of skeleton is free from metastases.**

Pathology Report

CLINICAL DATA: Right breast cancer, up frony surgery.

NATURE OF SPECIMEN: Right Simple mastectomy specimen & Right SLNs biopsy.

GROSS EXAMINATION:
-1- Procedure: Right simple mastectomy specimen measured 24x14cm with covering skin ellipse measured 22x12 cm .
• Tumor extent : Cut section revealed an ill defined firm greyish white area at upper outer quadrant.
• Size: measured 7x6 cm T3
• Skin involvement: unremarkable grossly
• Distance from margins: 0.5cm away from deep margin,1.5 cm from skin
2- SLNs biopsy: Fibrofatty tissue piece measured 2.5x2.5 cm enclosing 5 SLNs up to 1x1 cm
.
• Frozen section: positive SLNs (1/5) with no extracapsular extension.

MICROSCOPIC EXAMINATION:
• Histological type: Tubo- lobular carcinoma
• Grade (differentiation+ nuclear pleomorphism + mitosis): GII (3+2+1).
• Lymphovascular emboli: positive.
• Perineural invasion: No.
• Duct carcinoma insitu: No.
• Skin involvement: Free nipple and areola .
• Lymph node involvement: Positive SLNs (1/5) with focal early occasional extra capsular extension.
• Resection Margins: Free deep margin.

DIAGNOSIS:

Exam : MAMMOGRAPHY BOTH	Age : 39 Year(s)
Medical ID: 1543	Pat. ID: 16505

DIGITAL BILATERAL SOFT TISSUE MAMMOGRAPHY AND COMPLEMENTARY ULTRASOUND

Indication:

- Right breast palpable mass

Report:

- ACR B: mixed fibroglandular parenchyma.
- Right Breast:
  - UOQ peripheral irregular dense mass lesion with related parenchymal distortion . No overlying microcalcification. Corresponds by U/S to (11 o'clock) irregular heterogenous hypocchoic mass lesion measuring about 28 x 14 mm. It reached 3 mm form the skin.No evidence of pectoral muscle invasion.
  - Similar smaller mass is seen at (11 o'clock) measures 12 x 11 mm (noted at 2 cm distance from the forementioned mass)
  - No pathological right axillary LNs.
  - No supra or infraclavicular lymph node.
- Left Breast:
  - No suspicious micro calcifications or architectural distortion detected.
  - Complementary ultrasound no cystic or solid mass lesions.
  - Normal skin thickness, and nipple-areola complex with average caliber of the retro-areolar central ducts.
  - Nonspecific axillary LN.

Opinion:

- Right breast UOQ highly suspicious mass lesions, for histopathological assessment (BIRADS 4c)
- Normal sonomammography of the left breast (BIRADS 1)

Contrast enhanced Spectral Mammography

CLINICAL SUMMARY: History of previous right side intervention for lump (no available pathology, now presented with pathologically proved RT IDC

CC & MLO low energy & recombined (post contrast) images

FINDINGS:

Background Uptake: mild background enhancement

ACR: B

RIGHT BREAST:

- **Low energy (Non contrast) images** : UOQ asymmetrical density.
- **Recombined (Post contrast) images**: UOQ middle & posterior one thirds multiple confluent variable sized heterogeneously enhancing masses, globally measured 7.5x4x5cm located at about 3 cm from the nipple .
- Normal skin / nipple / areolar complex.
- **Complementary US**: Non specific axillay lymphnodes
- **LEFT BREAST:**
- **Low energy (Non contrast) images** show no masses, asymmetry or distortion or suspicious microcalcifications.
- **Recombined (Post contrast) images:** apart from faint enhancing **(glandular)** subcentimetric nodule located inner central middle third at about 8cm from nipple with no corresponding underlying abnormality seen by complementary US , no other pathological uptake detected .
- Normal skin / nipple / areolar complex.

IMPRESSION :

Right BREAST: UOQ multifocal malignant process as described (BIRADS 6= pathologically proved)

Left BREAST: benign central middle third enhancing(**glandular**) nodule (BIRADS 2= benign)

Patient Name: Entesar Kenawy	Date : 11/09/2022
Exam : C.T CHEST WITH CONTRAST	Age : 39 Year(s)
Medical ID:	

POST CONTRAST MULTI-SLICE CT SCAN OF THE CHEST, ABDOMEN AND PELVIS: -

Findings:

I Chest:-

- A single right upper lobe posterior segment nodule is seen measuring 6 mm.
- No hilar or mediastinal lymph nodes.
- No evidence of pleural effusion, pleural thickening or masses seen.
- Normal cardiac size and shape with no gross abnormality of the cardiac chambers. No pericardial effusion detected.
- Normal CT appearance of the thoracic aorta and the great vessels.

II Abdomen & pelvis:

- The liver is of average size with homogenous CT texture. No focal lesions or contour irregularities.
- Patent homogenously enhancing portal vein and is main branches as well as its main tributaries.
- No intra-hepatic or extra-hepatic biliary radicles dilatation.
- Normal size & parenchymal texture of the spleen with no focal lesions seen.
- Normal size, parenchymal thickness & density of both kidneys with no stones or back-pressure changes.
- Normal appearance of the pancreas, aorta, I.V.C and both suprarenals.
- Smooth filling of the urinary bladder with no filling defects or diverticular outpouching.
- IUCD is seen insitu.
- Normal appearance of the other pelvic organs.
- No abdominal or pelvic masses or collections.

Opinion:

- **Single right pulmonary nodule for close follow up.**
- **No CT evidence of metastatic hepatic or osseous disease.**

Left BREAST MAMMOGRAPHY WITH BILATERAL US

Indication:

Patient had right MRM

Technique

- Left breast MLO and CC views
- Bilateral ultrasound

Report:

- scattered fibroglandular densities of the left breast (ACR B)
- No spiculated masses or grouped microcalcifications.
- Complementary ultrasound also showed no left breast solid or cystic masses
- Normal skin thickness and nipple-areola complex, with average caliber of the retro-areolar ducts
- Nonspecific left axillary LN, with preserved fatty hila and uniform cortical thickness.

Free right operative bed with no evidence of recurrent mass lesions
Free right infra and supra clavicular regions.

MRM with free operative bed with no evidence of recurrent mass lesions
reast suspicious findings (BIRADS 2)

Yours truly

$Tc^{99}m$ MDP SKELETAL SCINTIGRAPHY

History:

- A 42-year-old lady, with history of breast cancer, referred for metastatic work up.

Technique:

- Anterior and posterior whole body scans were acquired 2 hours post injection of the tracer.

Findings:

- Enhanced tracer uptake is noted at DV3, DV12 as well as left sacroiliac region.
- No other abnormal active or cold focal bony lesions could be seen over the surveyed skeleton to account for metastatic bone disease.
- Degenerative changes are seen at the spine and big joints.

Impression:

- Worrisome osseous lesions at the aforementioned sites, likely metastatic.

Much obliged

Exam : ultrasound ABDOMEN& PELVIS	Age : 42 Year(s)
Medical ID: 3581/2021	Pat. ID: 16505

ABDOMINO-PELVIC ULTRASOUND EXAMINATION REVEALED:

Liver: -

- *Average in size (15cm at Rt MCL) homogenous parenchymal echopattern with smooth surface.*
- *No hepatic focal lesions or intra hepatic biliary radicle dilatation.*
- *Portal vein is patent and not dilated.*

Gall Bladder: -

- Average distention and capacity with no stones or mud
- *. The wall is not thickened.*
- *CBD is not dilated.*

Spleen: -

- *Average size, homogenous.*

- **Kidneys: -**
  - *Both are average in size, shape and echogenicity*
  - *No stones or dilated pelvicalyceal system*
  - *No gross lesion*

***Para-aortic and pancreatic area**: show no gross abnormalities.*

No ascites

Urinary Bladder: -

- *Average capacity with no stones or diverticular out pouching*

***Uterus and adnexal** ; no abnormalities could be detected, IUCD is in place*

Opinion:

Unremarkable study

Patient Name: Entesar Kenawy Helaly	Date : 20/07/2025
Exam : MAMMOGRAPHY BOTH	Age : 42 Year(s)
Medical ID: 3581/2022	Pat. ID: 16505

Left Digital soft tissue mammography with high resolution sonography revealed:

Clinical summary: 74 years old female underwent right MRM & ALAND, followed by hormonal therapy for two years, routine follow up.

Image:

Left breast.

- Scattered fibro-glandular densities. (ACR b)
- No speculations, masses, asymmetry, distortion or suspicious microcalcifications.
- Ultrasound demonstrated no solid or cystic lesions.
- Normal skin/nipple/areola complex.
- Non-specific axillary LNs.

Right mastectomy bed.

- Clear mastectomy bed with no masses or fluid collections..
- Clear right axilla. No pathological supra or infra-clavicular lymph nodes.

Conclusion:-

Left breast (BIRADS 1): normal study.

Clear right mastectomy bed and axilla.

Recommendation:-

- *Annual follow up.*

Best Regards,
DR, Amal Hegazi, M.Sc.

BIRADS classification of breast lesions according to the American College of Radiology used for breast assessment combined with recommendations:

Category & recommendations	Suspected Cancer Risk
BIRADS 0: Non-informative study.	
BIRADS 1: Normal study, routing screening	0 %
BIRADS 2: Benign findings, routine screening	0 %
BIRADS 3: Probably benign, for close follow up.	2 %
BIRADS 4: Probably malignant, for biopsy.	50 %
A: mild suspicion.	
B: moderate suspicion.	
C: high suspicion.	
BIRADS 5: Malignant, for biopsy.	98-100%
BIRADS 6: Pathologically proven malignant
