Tc-99m MDP bone scan.

Desired information : skeletal surveying to detect multiple lesions.

Technique:

Delayed Anterior and posterior whole body scan 2 hours after I.V administration of 20 mCi ^{99m}Tc-MDP.

Report:

Delayed Static Phase:-

- Degenerative changes are noticed over dorso-lumbar vertebrae.
- No definite hot spot that account for osseous deposits could be detected allover the surveyed skeleton.
- Both kidneys are normally seen

Conclusion:

- *The surveyed skeleton is free of osseous deposits.*
