Full field Bilateral Digital Mammography & ultrasonography

Clinical summary: 45 years old presented for Right breast palpable lump

Technique

- Craniocaudal & mediolateral oblique views
- High resolution ultrasound

Right breast

- Heterogenous fibroglandular pattern (ACR c).
- Irregular speculated dense mass lesion located at UOQ middle third
- Complementary US demonstrated the hypoechoic solid nature of the aforementioned speculated mass seen at 10:00 middle zone with another near smaller masses attached to it, total area measures 3.8x20mm, medial small mass measured 7.6x7mm
- Normal skin thickening and nipple areola complex
- Non-specific axillary lymph nodes.

Left breast

- Heterogenous fibroglandular pattern (ACR c).
- No masses, distortion or suspicious clusters of microcalcifications.
- Complementary US demonstrated scattered simple cysts the largest seen at 12:00 measured 24x12mm
- Normal skin/nipple/areolar complex.
- Preserved axillary LNs.

Conclusion:

Right breast: (BIRADS 5) UOQ speculated solid masses. Tru cut Biopsy is done on today sitting for histopathological correlation

Left breast: (BIRADS 2) Simple cysts

MAMMOGRAPHIC GUIDED STEREOTACTIC WIRE LOCALIZATION:

CLINICAL SUMMARY:

Right breast CA that was under NAC, for localization of the UOQ previously inserted clip

TECHNIQUE:

Under complete sterile conditions, 3ml of local anaesthetic were administered at the sites of concern in the right breast.

A 21G wire was used to localize the UOQ clip located at 2 o'clock, about 8cm away from the nipple, and the wire was inserted 4cm deep with the hook about 4mm from the clip, and 12mm deep to the skin

Post procedure films were done in MLO and CC views to confirm.

**Best Regards
Dr. Mahi Mokhtar**
