## IMMUNOHISTOCHEMISTRY REPORT

Clinical Data: left breast mass.  
Nature of Specimen: Tru-cut biopsy,

### Technique:

- Sections were prepared from the paraffin block, processed in Bench Mark ULTRA machine (Ventana) stained by rabbit monoclonal antibodies using Ultraview HRP DAB as chromogen and hematoxylin as counter-stain. The sections were treated against: ER clone (1E2), PR clone (SP1), Her2 clone (4B5) and Ki67 clone (30-9).

### Results:

- \* IPT (Positive control showed appropriate reactivity):
- ER: Strong nuclear reaction in 90% of tumor cells (Allred score 8/8).
- PR: Strong nuclear reaction in 80% tumor cells (Allred score 8/8).
- Her2: No membrane reaction in tumor cells (score 0).
- Ki67: 40% nuclear reaction of tumor cells.

### Conclusion:

Left breast cancer, Tru-cut biopsy:  
Invasive carcinoma with mucinous differentiation, Grade II,

### IPT:

- ER: Positive (score 8/8).
- PR: Positive (score 8/8).
- Her2: Negative (score 0).
- Ki67: Positive in 40% of tumor cells.

Printed By : Ali mostafa

Conclusion:

- Left breast: (BIRADS 5) Left multiple Multicentric malignant mass lesions with ipsilateral pathological axillary lymph nodes as described. Tru cut biopsy was done on the same day from the index lesion.
- Right breast: (BIRADS 2).

Recommendation

Dynamic MRI breast study is recommended.

Best regards,

Dr. Hedaya Nour, Msc

Dr. Omelsaad Ahmed, MD

### Pathology Report

#### Clinical data

Right thyroid cystic lesion

Nature of specimen

Cytology

#### Gross specimen

Four alcohol fixed smear slides stained with H&E

#### Microscopic examination

Examination revealed RBCS , Very few follicular cells

#### Diagnosis

Right thyroid cystic lesion, cytology

Hemorrhagic content , free of cytologic malignancy , Besthda system I

Comment: The BETHESDA System for reporting thyroid cytopathology:

diagnostic categories:

I. Nondiagnostic or Unsatisfactory.

II. Benign. Consistent with a benign follicular nodule (includes adenomatoid nodule, colloid nodule, etc.).

Consistent with chronic lymphocytic (Hashimoto) thyroiditis in the proper clinical context.

Consistent with granulomatous (subacute) thyroiditis.

III. Atypia of undetermined significance or follicular lesion of determined significance.

IV. Follicular neoplasm or suspicious for follicular neoplasm.

V. Suspicious for malignancy.

VI. Malignant.

- Averagely filled urinary bladder showing no sizable diverticular outpouching.
- No pathological abdominal or pelvic lymph node enlargement.
- No ascites.
- IUD is seen.
- D3 and right iliac wing sclerotic patches.

**Opinion:**

- Reported case of breast cancer revealed:
- No 'sizable pulmonary or hepatic deposits on non-contrast basis.
- Few osseous lesions for bone scan.

**ABDOMINO-PELVIC ULTRASOUND EXAMINATION**  
**REVEALED:**

**Liver: -**

- Average in size (about 16 cm at the right MCL), smooth outline, bright echopattern. No intra hepatic biliary radicle dilatation.
- Portal vein is not dilated and patent.

**Gall Bladder: -**

- Average size , normal wall thickness, no stones.
- CBD is not dilated.

**Spleen:** Average size (About 10 cm), displaying homogenous echopattern.

**Kidneys: -**

- Are of normal size and site , normal echogenicity , no stone or backpressure changes , no solid or cystic lesion.
- Both ureters are noted dilated.

**URINARY BLADDER:** Normal filling. Normal wall thickness, no stones or diverticulae or solid lesion detected.

**Uterus: -:**

- anti-verted, average sized uterus. Endometrial thickness measures about: 5 mm, no focal lesions.
- IUCD is seen in place.

**No adnexal lesions.**

- No free fluid in the Douglas pouch.
- Para-aortic and pancreatic area: no gross lesion

**Opinion:**

- Normal study.

Best Regards,  
Dr. Rasha Elrahim

### Women's Health Outreach Program

Name: Ayat Maamoon Madbouly

Date: 31-8-2023

### Bilateral Full field Bilateral Digital Mammography & high resolution ultrasonography examination

Clinical summary: Positive family history (1<sup>st</sup> degree relative) complaining of left breast mass.

#### Detailed Findings

##### Technique

Craniocaudally & Medio lateral oblique views

High resolution ultrasound

##### Left breast

- ACR C density.
- The left breast shows two UOQ and LOQ ill-defined spiculated irregular dense mass lesions associated with architectural distortion, measures about 19 x 14 mm and 11 x 10 mm and about 4 cm and 3 cm from the nipple respectively.
- Ultrasound demonstrated multiple at least five irregular ill-defined hypoechoic mass lesions as following:
  - Largest one located at 1-2 o'clock (Zone A), measuring about 19 x 14 mm (index lesion, where the biopsy was taken)
  - One located at 3 o'clock (Zone A), measuring about 11 x 10 mm
  - Deeply seated one located at 4 o'clock (Zone A), measuring about 11 x 10 mm
  - One located at retroareolar region, measuring about 3.5 x 3 mm
  - One located at 9 o'clock (Zone A), measuring about 13 x 11 mm (with suspected anterior ductal extension and away from the nipple by about 9 mm). Surrounded by few small tiny subcentrimetric satellites.
- Multiple left pathological axillary LNs with effaced hila at level I, II & III. The largest one at level 1 measuring about 20 x 12mm.

##### Right breast

- ACR.C.
- No masses, asymmetric densities, distortion or suspicious clusters of microcalcifications.
- Ultrasound demonstrated no solid or cystic lesions
- Normal skin/nipple/areolar complex.
- Preserved axillary LNs.
